# INTRODUCTION

HI, AND WELCOME to this bumper book of programs. *Your Computer* began publishing readers' programs in a special feature, called Pocket Programs, back in December 1982. They have been incredibly popular with our readers ever since and now appear every second month.

Happily, the supply of programs has outstripped our demand, which means we have a never-ending stock of good-quality programs to offer other readers. Recently, however, we have been embarrassed by the backlog. Programs were coming in much faster than we could print them and we were beginning to get buried under a growing pile of listings and documentation.

The solution was obvious: let's get all the programs together and publish the lot in one big collection. The contributors get to see their programs in print, you get a whole swag of programs to try out on your computer and we get to see what our desks look like.

Anyway, here they are: programs for the beginner through to the advanced; technical programs and games programs; programs from kids aged ten up to adults aged seventy. Programs in a variety of languages for all the popular machines and the more obscure ones as well. You will find lots of programs to use on your computer straightaway, and lots more that you can adapt from other computers and languages.

You will see we have divided the programs according to the machine they're written for: Apple, Commodore, Sinclair and so on. Don't restrict yourself just to looking at the brand you own. Many of the other machines' programs can easily be changed to run on different computers, and there are notes in some to suggest how you might go about doing this. In the miscellaneous section there are programs you can check out that are written more for a particular language

than a particular machine.

There are also a few tricks to typing in the program that might be useful. Here are some hints I have found useful.

First, place a ruler under the line you are typing to mark your place. You don't want to start typing the wrong line midway through another, or leave a couple out. The results can be catastrophic, almost as confusing as that last sentence.

Next, check the data in data statements very carefully. When you type in normal commands and make a mistake it is usually pretty obvious. For example:

```
IB A>0 THEN ABORT
```

is a lot easier to correct than, say:  
1000 DATA 143,233,233,087,323

One check you can make is to count how many numbers you should have typed in and how many you have typed in. You can also get someone to help you by reading the data to you while you type it in. If nothing else it makes for a more social occasion and makes your husband or wife, mother or father, feel wanted.

When you have typed in a program it may return an error. When you discover the line causing the error don't just check it and think "That looks OK". The best thing to do is read the line backwards, letter for letter and check each letter, number or control code against what you have typed in. That way you don't assume that everything is correct as you quickly flick your eye over the line. You plod through and verify every single character.

If you're still having trouble finding an error, another trick is to put a trace on the execution to follow the path the program takes. If your program loops uncontrollably you can use a command (TRON in many BASICs) which will show you the line

**By Evan McHugh**

numbers as they are being executed. Another thing you can do if you don't want to trace through the whole program is to sprinkle PRINT statements throughout or in selected locations. These can tell you all sorts of things about the execution. They can just say, "Hi, I'm at line 100 and everything is fine!", or they can tell you the value of the variable that seems to be causing the crash: "The value of C is 20."

With these few debugging tools, hopefully you should be able to work out about 99 per cent of the problems you may face. Of course, there is always that worst of bugs, the invisible, undetectable bug. These little monsters will have you tearing your hair out, glaring at your screen until three in the morning and in spite of your best efforts will never make themselves apparent. Often such bugs will cause you to despair, sell your computer and go on a skiing holiday to Europe with the proceeds.

It happens to every programmer from rank beginner to seasoned professional. For example, one of my computing lecturers was frowning at a listing a student had brought to her for some help. Another student noticed the frown and offered assistance.

"The bug must be in this line," said the lecturer, "but I've been looking at the rotten thing for two hours and there is nothing wrong with it. We've looked at everything; whatever it is must be pretty weird to cause an error." "Let's have a peep then," chirps the helpful student. "Ah yes, that comma should come before the variable, not after."

It had taken him three seconds to find the bug. It is times like that when quite talented people can get turned onto the alternative lifestyle, but please don't despair. Sometimes things can be extremely complicated with computers, but far more often they are extremely simple. The

solution is to get a second opinion. Another programmer used to get his kids to check his syntax when he ran into an error. They didn't know a thing about computers, but if he explained the way syntax worked they could pick up the obvious mistakes which he had looked at for hours without noticing.

Also, you should consider joining a computing club. You will certainly meet lots of people who will gladly take a look at a listing and point out any bugs that might be causing trouble. A full listing of clubs in Australia and New Zealand is printed in this book, and we update it from time to time in *Your Computer*.

If you still can't find the bug after trying all these avenues it is time to despair, sell your computer and buy a sailboard with the proceeds.

Hopefully, having tried some of the programs in this magazine you will be inspired to write some programs of your own that you would like to submit to us for publication. Please feel free to do so. The programs we like best are ones that have some creativity about them. Say, a new way of performing an old routine, or a game that has not been put on a computer before, or a useful routine that works faster than any that are around at the moment.

If you are a rank beginner don't think there are no programs you can send in. There are plenty of other rank beginners out there who will probably find that your programs are just at the level they can understand. So, send those programs rolling in.

We hope you have lots of fun with the programs in this magazine. There is something for everyone. And, as my desk diary for today says, "You should try everything once, except incest and folk dancing", which I'll admit is a trifle weird, but it's not a bad approach to trying out the programs!

Enjoy and Keep On Computing! ■

# GET AMONGST THE ACTION!

*There's a whole world of 'action' on the bands between 30 MHz and 500 MHz. No matter whether you're interested in VHF/UHF DX, or just the local 'chatter', a scanner will put you 'in touch' with that world of action.*

---

*Australian SCANNER'S WORLD is the book that will introduce you to that other world 'beyond the shortwaves'. It contains an introduction to scanning and scanners, an article on scanner antennas — including how to build two types for yourself, along with how to erect antennas. The major part of this book is the "Listener's Guide", computer — sorted listings of services throughout Australia and New Zealand, with their frequencies listed in both frequency order and alphabetical order by service. Beacons are listed also, along with relevant overseas ones. A roundup of scanners, antennas and accessories is also included.*

---

# PROGRAMS FOR APPLE II

## FROGGER

Frogger is a two part program, connected by the CHAIN program on the DOS 3.3 SYSTEM MASTER. The listing REM FROGGER should be saved under the name of "FROGGER", and the other under "FROGGER@". A copy of

CHAIN is expected to be present on the disk when FROGGER is run.

To guide the frog:  
A - up, J - left, K - right, Z - down.

M.J. Smith  
Waramanga ACT

## PERSPECTIVE

If you've ever wondered how they do those fancy 3D graphics displays on the TV ads, then this program is for you. The program requires the user to supply the 3D coordinates of the vertices which make up an object. The user must also specify which points are to be joined by straight lines. Once the object has been defined, it is displayed on the high resolution graphics screen and can be scaled up or down or rotated about any of the three spatial axes using a joystick connected to Port 2.

The data which defines the shape can also be saved on a tape file for subsequent reloading.

Objects can be described with up to 48 vertices, allowing quite realistic 'wire frame' draw-

ings to be displayed. The display shows the object in true perspective, initially straight down the 'Y' axis. Rotation about the 'Z' axis is achieved by moving the joystick left or right, about the 'X' axis by moving the joystick up or down and about the 'Y' axis by pressing the fire button. With the fire button held down the object continues to rotate about the 'Y' axis. When the fire button is next pressed rotation recommences but in the opposite direction. Rotation about all three axes at once is thus possible.

The HIRRES graphics routines must be present in memory before the program is run. The program itself is then loaded in two parts - a BASIC program which POKES the perspective graphics routines and variables

into memory, followed by the program which allows definition of shapes, scaling and tape file handling. The loader program splits the data into eleven separate blocks to facilitate checking and correction of data.

Shapes are rotated by increments of two degrees and the speed of rotation is dependant on the complexity (number of vertices) of the object. Whilst rapid, smooth movement is not possible with a computer such as the Commodore 64, movement is acceptably fast - but judge that for yourself.

Definition of shapes is accomplished in two stages:

1) The X, Y and Z coordinates of each of the vertices which make up the object are first supplied by the user. In general, these coordinates should not

```

# APPLE II

## LINEAR EQUATION

Two co-ordinates are entered in the form (X1,Y1) and (X2,Y2). From this data, the computer will work out the equation of the line joining these two points. It takes into account whether the line is vertical or not.

In addition, the computer will

also give the midpoint, distance, gradient, y-intercept and x-intercept of the line. It takes into account whether the gradient, y-intercept or x-intercept is undefined.

Great for working out maths homework. Will work on any computer using BASIC.

S. Chan  
Minto Heights NSW

# SPECIAL FUNCTION KEYS

This program will let you type in commonly used DOS commands (CATALOG etc) and Applesoft reserved words (INPUT, FOR, NEXT etc) using the control characters. For example, typing control-I will cause the word INPUT to appear exactly as though you have just typed it in from the keyboard, character by character-but it only takes a small fraction of the time. Great news for hunt and peckers!

The list of keywords and the control characters which represent them are given in the table. Putting stickers on the keys is fine in the short term, but eventually they tend to gum up the works (pun intended).

Notice that not all the avail-

able control characters are used. Some are used by Apple for special purposes (namely control - C,D,G,H,J,K,M,S,U,X).

To type in this program, first ensure that DOS has been booted, then enter the Monitor by typing CALL -151 when you will see the prompt \*. Now simply type in each line of the hex code as it appears in the listing - begin each line with the line number, to be followed immediately by a colon (:) and then the first 2 digit hex code and so on. After entering the program, type 3DOG to return to Applesoft. Save the program on disk using the command: BSAVE CUSTOM KEYS, A\$9500, L\$FF

To use the control character

utility program, simply BRUN it from disc after booting DOS. Better still, BRUN it in your HELLO program. This program can be temporarily disconnected by a RESET or a CALL 38164. When BRUN from disk this program will be located in memory just below DOS at starting address \$9500 (hex). It also protects itself from being trampled upon by Applesoft by resetting HIMEM.

This program will work on an Apple II plus with DOS 3.3, an Apple work-a-like (provided it is sufficiently alike) or an Apple IIe in the 40 column mode. It is incompatible with the Apple IIe 80 column firmware which uses many of the control characters to provide special 80 column functions.

```

Writing programs requiring retrieval of files from a disk, I found it desirable to have the catalog of disk files displayed on the screen from within a BASIC program to assist the program user to enter the filename as it is stored on the disk. A more useful feature would be to have the displayed file selectable.

The program is essentially in two parts. The first part handles the DOS alteration to display one 'page' of the catalog at a time (18-21 lines). The second part of the program manipulates the screen cursor and performs DOS commands on filenames present on the screen.

The program listing contains a liberal sprinkling of REMark statements which summarise the workings of the program. These lines can be left out when typing in the program, as they are not referenced by any GOTO's or GOSUB's. A list of the main variables used are given in figure 1.

Note: It is advisable when first running the program to use a backup copy of your disk and double check the expressions in the POKE statements. Indiscriminate poking around in DOS could produce disastrous results.

## 'ULLO 'ULLO

This program includes two new features:

1. The 'Flash Catalog' routine from the Apple DOS (3.3) Manual, which displays hidden control characters in file names as flashing letters\*

2. The capability to create and use Exec files, and to set up a series of commands to be executed automatically on start-up.

These facilities may be operated by options 7 (Sys Gen) and 8 (Flash Catalog) on the menu; i.e. the message that scrolls around at the bottom of the screen. Files may be executed by using option 6 (Exec).

For the uninitiated, control characters can be put into file names as a sort of password; they can be extremely annoying if you forget what or where they are.

# APPLE SPACE WAR

This is basically a Space Invaders type of game, with both player and aliens using laser weapons rather than missiles. The player has only one life, but starts with 100 energy points which decrease when he fires at, or is hit by, aliens.

It is possible to earn a score of 200, and 20 energy points, by hitting the strongest alien, but that being can inflict up to 105 points of damage on you!

The program includes instructions for playing, which may be

chosen from the startup menu, and has two special features:

1 - The top fifteen scores, and the players names, are stored permanently on disk.

2 - A "Demo" mode, in which the computer plays both sides. If left unattended, the program will automatically enter this mode returning to the menu after each game to give a human a chance (if one is present). The computers top score is 180.

The game normally starts with one alien, with more (up to

20) appearing as the game progresses. The starting

number may be altered by changing the value given to NT in line 490.

If you experience problems with the disk file, try changing line 1190 to read: 1190 PRINT D\$;D\$;"OPEN";F\$. On the subject of the disk file, use the program "Hiscore Creator" to set up the file before your first game (or to erase the high score table later).

branch to error message.

Array N\$( $\Phi$ ) found. Advance a further 7 places to length of N\$( $\Phi$ ). Place that address in \$1050-1051.

Jump to find address for length and pointers of final item N\$(500).

Error message.

Holds address of N\$(500) length.

address of length & pointers for N\$( $\Phi$ ).

Gap between items being compared. Goes from 251 to 1.

Address for lengths of two items being compared.

- swap flag.

GET ADDRESSES for length of 1st. two items to be compared.

Using the gap found at \$1052 (this moves to \$1058), get the addresses for the lengths of the first two items to be compared; place in 1059-105A and 105B-105C.

SUPSORT is an assembly sort which sorts 500 or less records. It will sort 500 disordered records in about 30 seconds. (It will sort a reverse ordered list in about half that time.)

The program does the following:- 1. Finds the addresses for the lengths and pointers of an array called N\$(501).

2. Then runs a 'shellsort' type sort. It compares items 251 apart (swaps if necessary), then items 117,53,232,7,3,1 apart on later runs through the list.

3. If only, say, 200 records are being sorted, it still runs through this sequence. As Applesoft sets all arrays to zero at the start, this does not matter.

By no means is this the ultimate sort for this type of sort. The times could be improved by at least a factor of two (I believe) if the 'Bubblesort' part at the end ran in two directions, and only checked the unsorted part of the array.

'SORTEM' is a program that calls 'SUPASORT' to sort its array. It dimensions an array N\$(501), then loads records

## SORTS

▷ into this array from disc. It then calls 'SUPASORT' which sorts the records, and 'SORTEM' puts them back on disc. (It also displays the sorted records first, but this is of course unnecessary).

'C\$RITE' takes ten records and writes them to disc 50 times; creating a text file of 500 disordered names.

'C\$NANNUM' places 500 records onto disc, and 'RESORT'

is an example of a program which tags the records as they are read off the disc.

'RESORT' loads records from the disc in reverse order, to see how the sort goes with a reverse order list. 'SSORT' is an attempt to use the 'SUPSORT' with 1000 records. Larger gaps are poked into the 'gap' part of the assembly program. 1000 records take about 3 minutes to sort.

### Sort

If 2nd. length zero, advance to next two items.  
If 1st. length zero, SWAP.

Advance through items one letter at a time. If 2nd. smaller, "SWAP".

If length 2nd. runs out first, SWAP.

Advance addresses of lengths 3 positions to get addresses for next two items.

### SWAP

Exchange lengths and pointers of the two items.

after running through item Gap of 1? (#1062 to #05).

(a) No. Increment #1077 to get smaller gap.

(b) Yes. Adjacent items being compared. Jump to 11B2 to see if any swap occurred.

any swap?  
(a) No. Run through list again.  
(b) Yes. Finish.

# SHOOTOUT

Shootout is a game requiring fast reflexes and keen eyesight. You are the fastest gunslinger in the west, and have been challenged by the Mexican gun-fighter, El Ppa (amazing what some people's names spell backwards translate as). His face (he don't look real mean, but he's quick on the trigger) appears on the screen. After a short pause the word DRAW also appears, with a beep if the easy game has been selected, without it the hard game is indicated.

When this happens press any key to fire. If you were quick enough, you win that shootout. If not, well, you get another chance (you can have up to 10 chances) unless that was the last battle. Your scores and his are totalled and the winner is announced.

El Ppa can be slowed down by increasing the number in line 230 or sped up by decreasing it.

## GRAPHICS DRAWER

Graphics Drawer enables the user to draw graphics on Hi-Res Page 2 using the Apple's keyboard.

The controls are as follows:

I - draw line upwards  
J - draw line left  
K - draw line right  
M - draw line downwards  
O - draw line diagonally up - right  
U - draw line diagonally down - left  
, - draw line diagonally down - right (NB all the above keys are for movement.)

C - colour (0&4 - black, 1 - green, 2 - violet, 3&7 - white, 5 - orange, 6 - green)

D - Increment - how many dots plotted per keypress.

An example of Graphics Drawer has been included to show its capabilities. There is also another program - Sample Pattern Routines which has some interesting routines.

# COPY PROTECTOR

This program prevents copying, and, in fact, looking at programs on your disk. It uses the RWTS subroutine to change the directory file location. It is left to you to decide how to encompass this into your own greeting program. The basic idea of this program makes it quite flexible and it can be easily expanded as I will describe later.

Bytes Accessed:

\$303 - Volume Number  
\$304 - Track Number  
\$305 - Sector Number  
\$306 - Command (01-Read 02-Write)

If you want to look at any sector on your disk or in fact when you set up your copy protector system, you just change the above four locations as required and type 315G. The sector read or written will be from \$2000 - \$20FF. This buffer can be changed by altering locations \$308 (low-byte) and \$309 (high-byte).

Take a newly initialised disk and type in the program below and save it as the greeting program.

10 HOME  
20 ?CHR\$(4);"BRUN DC" 30  
?CHR\$(4);"CATALOG"  
CALL-151 and type in the hex DC program as given and bsave it as the file name in 20.

Using the 315G procedure above, copy the directory of track \$11-sector \$0F into track \$22-sector \$0F. You now have a real directory in track \$11 and a false one in track \$22-sector \$0F. When the disk is booted the program will change the VTOC so that a catalog will show the false directory. In fact, DOS can not load a program unless it is contained in the directory. To get the real directory back you simply CALL-151 then 333G.

The system I use is slightly different to the above and was first placed on a half full disk. The difference is that the greeting program is different for each directory but has the same file name.

The false directory is exactly the same as the above but the real directory points to a different track/sector list.

The easiest way to accomplish this is to save the real directories hello program as normal. Then save the false directories hello program on another disk or under a new file name on the disk you are copy protecting. Now transfer the false directory containing the files, HELLO and DC, into track \$22-sector \$0F by the "315G" method, using track \$22-sector

\$0E as the track/sector list for the hello program. Write the track/sector list into the data buffer, using track \$22-sector \$0D as the first and only file location, and save this into track \$22-sector \$0E. Then load the actual tokenised sector (NB - the above hello program occupies only one sector), from the disk used to save the false hello program, into the data buffer so that it can be saved into track \$22-sector \$0D.

When the disk is booted the false directory will be used and the catalog will show the two files, HELLO and DC. This allows you to still retrieve the real directory even if the disk has not been booted.

Also, it is important to adjust the track-bit maps to show the sectors you have used with the RWTS. All the relative information can be gained in the DOS manual under storage of files. For the system to work, both hello programs must first BRUN DC or the false directory must first BRUN DC and the VTOC must point to the false directory while you are not using the disk. This is done by BRUNING DC for the first and second cases or booting the disk in the first case.

# APPLESOFT COMMAND

With this short routine, you can type BASIC commands using a single key with the control key. The keys and keywords I have chosen are shown in the table at the end of the program.

BASIC commands begin at \$D0D0 and occupy consecutive locations to \$D25E. The first seven keys (@ to F) access commands on page \$D0. The keys G to Y (excluding H, M and U) access keywords on page \$D1, whilst Z accesses a

keyword on page \$D2.

The number of keys which access pages \$D0, \$D1, and \$D2 could be changed altering the numbers in locations \$0333 and \$033D respectively.

The keywords could be changed by substituting the least significant byte of the address of the new command for one of those on the list.

Enter the monitor and type in the program beginning at \$0300. Save the program by typing:

BSAVE ACE, A\$300,L\$91

To run the program type BRUN ACE from disk or BLOAD ACE followed by CALL 768. If you begin the program from the monitor with 3006, you must re-enter Applesoft by typing 3D0G, as typing Control-C will produce CALL. Before running a program in Applesoft hit the reset button to revert to the normal input routine.

The program works by passing all input through ACE. If

# ENTRY

CTRL is pressed, the key following it is used to generate an index to obtain the least significant byte of the address of the BASIC command which is stored in a table beginning at \$0376. This byte is then stored in \$1A.

The most significant byte is stored in \$1B and has an initial value of \$D2. This is decremented to \$D0 if keys @ to F are pressed and to \$D1, if any other key apart from Z is pressed.

BASIC commands are stored with the MSB set only for the last character, and this is used to clear the word end flag (\$19). A character counter (\$07) provides the index to obtain each character from the keyword after its address has been located.

The initialisation routine sets the input hook to the beginning of the ACE input routine at \$0319.

# APPLE II

# APPLE II

## TYPE

Type is a game designed to increase your typing skills on the Apple. It clears the screen and flashes a letter on the screen in a random place. You are given a certain amount of time in which to press that key (time is selected at the beginning of the program by the user). If you do not press the key within that time you go onto the next key (10 to 50 letters, selected by you at the beginning of the program). If you press the incorrect key, you are not penalised but must still press the correct key.

This program could easily be adapted for use on other micros. The statement in line 1600 simply clicks the speaker. The timing may have to be adjusted on faster or slower micros (this was done on a IIe). This is in the for-next loops.

The statement in 1300 simply gets a character or checks if one has been pressed. It can be changed to an 'INKEY\$' statement. 'Inverse' makes all characters printed after it appear black on white (instead of white on black) until the 'Normal' statement.

All the rems can be omitted.

# LORD OF THE RINGS

This is a program written for a 48K Apple II+ aimed at restoring peace to Middle Earth. It is a long listing and to save typing it out, I will put it on disk for everyone who sends me a disk and five dollars. All proceeds will go to the Parkes High School Computer Club. Please mark all parcels "Computer disks - keep away from magnets". Write care of Your Computer and it will be passed on.

Shaun Humfrey  
Parkes NSW

```

# RAIDERS

The object is to enter a maze of caves, acquire the golden idol and return.

Along the way you may pick up objects which will help you. For example the rope must be used to swing across the crevices and the shield is protection from the darts. Gold is used to buy maps. Torches and elixers fend off monsters.

On the map black indicates a wall and cannot be passed.

When darts are being fired at you, defend yourself using Paddle (O) to move the shield. You must knock out 4 of the 7 darts. When in battle with a monster use the key 'p' to bash him and 's' to shield...

**Mike Bantick**  
**Mount Beauty Vic**

# TIME PILOT

This is an action/low resolution program for the Apple II. You control an aircraft able to travel through time zones and encounter a variety of enemies in each zone.

Starting in the year 1910 you battle the bi-planes that zoom from all directions. Use the arrow keys to rotate the jet 45 degrees in any direction. Pressing the space bar fires missiles (missiles? in 1910? Ed) unless there are already two missiles on the screen.

Each time an enemy aircraft

passes over your central jet you lose a certain amount of shielding depending on how long the enemy stays there. As each enemy craft is shot down the red line at the top of the screen recedes until you have amassed a total of 40 hits. Large alien craft appear at the top of the screen. When destroyed they are worth 500 points and transfers your jet to the next time zone.

**Mike Bantick**  
Mount Beauty Vic

WIPEOUT is an educational drill and practice program designed to strengthen place value skills. The student can select the magnitude of the numbers to be worked with - six levels (tens through millions) - and instructions can be called for at any point during the game.

The student is required to 'wipe out' the randomly selected digit in the randomly selected number within the range chosen. For example, to 'wipe out' the '3' in 23 576, '3000' is entered as the number to be subtracted to give 20 576.

# APPLE SPEED LOCK

Lots of unlocked files on your disk, and hours of typing to lock them up away from the kids? Try Speed-Lock.

The Speed-Lock will first catalog the disk, and when the end of catalog is reached, a short data POKE sequence is run, (about 6 seconds) and a menu placed at the top of the screen: Lock, Unlock, Normal, Quit. Selection of Lock will cause the drive to step through each listing on the Displayed catalog only, and lock the files.

Unlock performs in the same manner. Normal simply catalogs the disk, then exits the program. Quit simply clears the screen and ends.

For disks with full catalogs, that is, more than 1 screen-full, only the last screen display will be locked. A short catalog interrupt sequence should be no problem so you can lock the first screens and then move on.

**R. Chalmers**

## HI-RES REVERSE

When using the Apple's hi-res screen, you have a whole world of graphic capabilities at your fingertips. But sometimes, as I have found, you can create a complex picture or graph and then say to yourself 'It would look a lot better if the whole screen was reversed'. Here is a short Assembly Language program that will do this for you. To utilise it simply BRUN the program after saving it to disk.

# PROGRAMS FOR ATARI

## COPY SELECTOR

Have you ever wished that you didn't have to enter DOS to search disk directories for a particular program? How about single key input to run the program once found?

Selector was written with both of these ideas in mind to allow my children easier access to our games disks. It will accept up to 50 filenames from a disk, although this may be increased to the ATARI's maximum of 64 by changing the DIM FILE value in line 600. 50 should be sufficient for most disks.

SAVED programs will be RUN upon selection and LISTed programs will be ENTERed. I have assumed that LST will be used as a filename extender on LISTed programs, as recommended in the DOS Reference Manual. A load will be attempted for any file selected, however, an error message results if the load is unsuccessful (for example, if trying to load DOS.SYS).

I have made this program an AUTORUN.SYS file on all of my disks so that my children can easily select their program as soon as the disk boots, or simply read directories until they find the program they wish to run. This was achieved using the program from Automate Your ATARI, written by JJ Wrobel and published in the January 1983 issue of COMPUTE magazine, page 146.

# PROGRAMS FOR COMMODORE 64

## WORD TEASER

Word Teaser is a game designed to trick your friends into believing that you have one of the most intelligent computer in the world.

When you have keyed in the program and run it you will be confronted by the question "Are you ready to start?" If you type in yes the game will start, if you type in no the program will end. If you type in an asterisk instructions will be displayed on the screen.

After you have read the instructions try the program on your friends, they will be amazed.

This program uses the HIRES machine code routines to plot graphs of user-supplied functions within a range of values specified by the user. The desired function is simply input; the program contains a mini-interpreter to code the function and allow the X and Y coordinates to be calculated for the plot.

The plot is automatically scaled, graduated and labelled, X and Y axes are displayed, and the title and range indications are displayed. The program allows functions to be plotted which include any of the normal arithmetic operators as well as SIN, COS, TAN, ATN, EXP, LOG, SQR, ABS and INT. The exponentiation 'up arrow' and parentheses may also be used.

The range of X values required should not include any values for which the function is undefined (eg. division by zero).

The HIRES routines must be loaded into memory before this program can be run. Take great care when typing this program into your computer that there are exactly 59 spaces between the '=' and the '2' in the first line.

# SYNTHONY

Synthyony is a music/sound effects experimentation program which converts the Commodore 64's keyboard into a three-octave musical keyboard with full notes on the 'QWERTY' and bottom rows and half notes where appropriate on the intermediate rows.

The program uses voice 1 of the Commodore 64 and allows the user to alter the ADSR envelope, waveform and other parameters by simple manipulation of the special function keys. Formatted screen output makes these changes and displays the appropriate sound chip registers and the values currently being POKEd into them. The program can thus be used for simple entertainment, including playing tunes and experimenting with sound effects, or for developing tunes or sound effects for subsequent use in games, programs, etc.

Independent selection and alteration of attack, decay, sustain and release is provided, as well as waveform and echo selection. When pulse waveform is selected, provision is made for independent alteration of high and low pulse width. Echo can be selected and is implemented by simple modulation of the volume register. Note duration is automatically adjusted according to the attack and decay settings. The purpose of function keys and current status of all of the above parameters are displayed on the screen.

The musical note equivalent of keys and the corresponding high and low frequency values are shown in the first table. Refer to your Commodore 64 Users Manual for the values required for notes outside this octave range. The second table suggests some combinations to try.

```

exceed +50 or -50 in magnitude, otherwise subsequent rotation of the shape can produce somewhat strange results (the program will not crash however, even under these circumstances). If the coordinates are initially too large or too small, the object can be scaled (eg. a scaling factor of 2 will double the magnitude of all coordinates, whereas 0.5 will halve them). The object rotates about the point  $X=0, Y=0, Z=0$  so that positive and negative coordinates are usually required.

If the example block shape above is to be a total of 40 units long in the X direction, 12 units in the Y direction and 20 units in the Z direction, then the coordinates of its eight vertices will be:

Vertex	X	Y	Z
1	20	6	10
2	20	-6	10
3	20	-6	-10
4	20	6	-10
5	-20	6	10
6	-20	-6	10
7	-20	-6	-10
8	-20	6	-10

2) The program must then know which of the above vertices are to be joined by straight lines when the object is displayed. This is accomplished by supplying a series of 'edge indices'. In the block example, the indices could be:

-1,2,3,4,1,5,6,7,8,5,-2,6,-3,7,-4,8 - a total of 16 indices.

The magnitude of the index corresponds to one of the vertex numbers above, and a negative index indicates 'Do not draw to this point'. Taken in stages, the indices above will produce the following action:

- 1 do not draw
- 2 draw from 2 to 1
- 3 draw from 3 to 2
- 4 draw from 4 to 3
- 1 draw from 1 to 4
- 5 draw from 5 to 1
- 6 draw from 6 to 5
- 7 draw from 7 to 6
- 8 draw from 8 to 7
- 5 draw from 5 to 8
- 2 do not draw
- 6 draw from 6 to 2
- 3 do not draw
- 7 draw from 7 to 3
- 4 do not draw
- 8 draw from 8 to 4

In each case, if the index is positive, a line is drawn from that vertex to the previous one. The first index must always be negative because there is no 'previous one' in this case.

The program allows for up to 96 indices to be supplied, but the speed of drawing is improved by minimizing the number of indices (ie. minimize the number of 'do not draw').

**MAGAZINE** FOR BUSINESS AND PLEASURE

**\$2.50**

**Incorporating "Your Business Computer"**

*Into computing? This is your magazine! Just look what's in it for you!*

## NEWS

'Your Computer' brings you all that's interesting, innovative and inventive in the microcomputing world — news of products, plans and politics to keep you up-to-date with what's going on in this fast-moving industry.

The latest machines and software from all the computer manufacturers are reviewed each month in 'Your Computer'. Keep up-to-date with what's available, and use our reviews to help you assess which products are most useful for you.

## REVIEWS

## TUTORIALS

**Les Bell**

'Your Computer's' tutorials include regular series on such popular subjects as the BASIC programming language and dBase II, probably the biggest-selling database program of them all. Written by such well-known industry experts as Les Bell, they're an invaluable aid to learning how to make computers work for you.

'Your Computer' regularly publishes all kinds of programs written both by professional programmers and readers, and ranging from games to business uses, utilities to additions and alterations to well-known programs. All kinds of computer users and enthusiasts will find programs to suit them in our pages!

## PROGRAMS

**AUSTRALIA'S  
TOP-SELLING  
COMPUTER  
MAGAZINE**

AUDITED SALES

## Your Computer

is a magazine for all computer users and enthusiasts — there's something for everyone in our pages. We cover games and utility programs for hobbyists, and every second month we publish 'Your Business Computer' as a separate section for business computer users. 'Your Computer' offers topical features on all aspects of the computing world, written in understandable everyday language, along with reviews of new products to help you find your way round the fast-growing market, and regular columns giving specific advice on all the most popular brands of microcomputer. If computers play any part in your life at all, don't miss your monthly issue of 'Your Computer' — without it, you just won't know what's going on!

READY.

## START MATHS

Start Maths is an addition and subtraction drilling program for the Commodore 64 suitable for ages 6 to 12. It first asks for the level of difficulty; enter '1' for easy to '5' for hard. You will then be given five sums involving addition and five involving subtraction.

After the ten sums have been completed you will be asked if you want any more sums. If you require more press 'y', if not then press 'n' to be returned to BASIC.

## HI-RES

What's needed for the Commodore is a package of cheap graphics routines which will enable high resolution graphics mode and make it easy to plot dots, lines, circles et cetera - so here they are.

The HIRES package of machine code subroutines is loaded into the Commodore 64's memory from \$C000 (49152) to \$C901 (51457), an area of memory which is not used by BASIC. The routines are accessible from BASIC by simple POKE and SYS commands. They allow setting up of bit mapped (high resolution) graphics mode, clearing the bit mapped screen, setting the colour of the foreground and background, and the plotting of dots, lines, circles and ellipses. With these routines in memory, you can write your own BASIC programs using the subroutines described below.

The subroutines which make up the package may be found at the following memory locations:  
Subroutine SETUP \$C1B0

(49584) to \$C1CA  
Subroutine CLRSCN \$C1CB (49611) to \$C203  
Subroutine SETCOLR \$C204 (49668) to \$C22E  
Subroutine DOT \$C22F (49711) to \$C27E  
Subroutine LINE \$C27F (49791) to \$C475  
Subroutine CIRCLE \$C721 (50977) to \$C901  
The remaining memory space is reserved for variables used by the routines.

To initialize bit mapped mode:

SYS 49584 (SETUP)

This routine calls two other routines:

a) Subroutine SLRSCN at 49611 which clears the bit map. This routine can be used by itself to clear the screen at any time by (SYS 49611).

b) Subroutine SETCOLR at 49668 which sets the colour of each area of the bit map. The colour defaults to 3 (black on cyan), but may be altered by POKEing 49681 (\$C211) with the number shown below, be-

fore calling either SETCOLR or SETUP.

POKE 49681,N where N = SC + FO\*16

SC is the required screen colour and FO is the required foreground (dot) colour. In both cases, zero = black, one = white, two = red, etc ...

To plot a dot at any location (X,Y) on the screen, where X = 0 to 319 and Y = 0 to 199, X must first be split into high and low bytes, so a complete routine would be:

```
SYS 49584 (SETUP)
POKE 253,1 (SWITCH TOGGLE ON)
HX=INT(X/256):LX=X-256*HX (SPLIT X)
POKE 49581,Y:POKE 49582,LX:POKE 49583,HX (POKE X,Y)
SYS 49711 (DOT)
```

The last three lines can obviously be written as a BASIC subroutine and called whenever required.

To plot a line on the screen the switch (2543) must be set as above, then the starting (X1,Y1) and finishing (X2,Y2) coordinates of the line must be POKEd. Again each X coordinate must be split into two bytes.

```

1530 L=ASC(LEFT$(A$,1))-48:R=ASC(RIGHT$(A$,1))-48
1540 PC=(L+7*(L>11))*16+R+7*(R>11)
1550 POKE SP,PC:CH=CH+PC
```

SYS 49584 (SETUP)  
 POKE 253,1 (SWITCH)  
 POKE 49581,Y1:POKE  
 49578,Y2 (POKE Y1,Y2)  
 HX=INT(X1/256):LX=X1-256\*  
 HX (SPLIT X1)  
 POKE 49582,  
 LX:POKE49583,HX  
 (POKE X1)  
 HX=INT(X2/256):LKX=X2-  
 256\*HX (SPLIT X2)  
 POKE 49579,LX:POKE  
 49580,HX (POKE X2)  
 SYS 49791 (LINE)

Again, the last six lines can be set up as a subroutine in BASIC to plot any line (X1,Y1)

to (X2,Y2). It should be noted that SETUP may only need to be called once in a particular program, and the switch remains set unless SETUP, CLASCN or POKE 253,0 is used. These two lines are, therefore, excluded from the subroutine.

To plot a circle, ellipse or arc a large number of parameters can be specified to describe the required curve. The routine below includes all options; note that a variable C has been used to simplify the routine.

(XC,YC) are the coordinates of the centre of the circle or ellipse, with XC again having to be split into two bytes. RX is the radius in the X direction and RY is the radius in the Y direction (up to 255 each). IA and FA are the initial angle and final angle respectively, where a full circle has 100 degrees. Curves are always drawn clockwise, so 0 = 'east', 25 = 'south', 50 = 'west', and 75 = 'north'.

GW is a variable which can be used to produce dotted curves. GW = 0 or 1 will produce solid curves up to radii of 160. Setting GW to a higher number (for example 10) will produce a dotted curve (GW = gap width between dots).

The above subroutine can be simplified considerably if all options are not required (default conditions will apply). If only solid curves are required, leave out line 1000 (GW defaults to zero). If complete curves are required rather than arcs, leave out line 900 (IA defaults to zero, FA defaults to 100). If circles are required rather than ellipses, leave out line 800 (RY defaults to = RX).

When the routines are loaded into memory, they leave all of the BASIC memory area untouched. However the bit map-

ped screen, starting at 8192 (\$2000) is in the middle of the BASIC program area. Thus a program plus variables of more than 8K will 'crash into' the high resolution screen memory area. This can be avoided by setting the bottom of BASIC above the hires screen area to 16384 (\$4000), before loading a subsequent large applications program, leaving about 24K RAM available for BASIC. This is a system limitation, but not a serious one, since most applications programs will not approach this size.

The routines are loaded by the BASIC program listed in this article. Once loaded the BASIC loader program can be cleared, and the machine code remains in memory until you turn the power off.

The routines can be called from machine code by using JSR and the appropriate hex. address. Machine code programmers should note, however, that locations 251 (\$FB), 252 (\$FC), and 253 (\$FD) in zero page memory are used by the routines, and must therefore be avoided by applications programs.

If you have a machine code monitor you can speed up subsequent loading of the package

```
100 C=49352 (SET C)

```

by saving it directly in machine code form as below:

With your monitor in memory, load and run the BASIC program. Enter the monitor and save HIRES by -

S"HIRESMC",01,C000,C902  
S"0:HIRESMC",08,C000,C902

You can then use  
LOAD"HIRESMC",1,1 or  
LOAD"HIRESMC",8,1 to load  
the package directly into the  
correct place in memory.

## DATAMAKER

As a person who writes many programs in machine code for the Commodore 64 I have found a great need for a utility program that will convert a block of data into Basic DATA statements. The attached program does this very quickly.

It is written entirely in machine language and doesn't interfere with the Commodore development kit, on which it was developed.

To use this utility type in the BASIC loader and save it. Run

it and after a while, if all goes well, the usual READY prompt will appear. The DATAMAKER utility is now installed and is ready to use at any time until the computer is turned off.

To call the routine type:

SYS 50768, first, last, line number where 'first' is the decimal value of the starting location of the block of data to be converted into DATA statements. 'Last' is the decimal value of the last element in the block of data to be converted

and 'line number' is the line number that you would like the DATA statements to start numbering from.

There is only one restriction that I am aware of with this routine that the user should know about. The three parameters, apart from being in decimal, must be less than 32767 or an illegal quantity error is issued. This might pose problems if your data is located in the top half of the computer's memory or you want very large line numbers.

The problem is caused by one of the BASIC ROM routines used to process the parameters. To overcome this you must play a little trick and enter the desired 'large' number in a modified form. Let's say that you want the DATA statements to start numbering from 50000.

Instead of entering 50000 as the start value you must calculate 50000 - 65536, which is -15536, and use this as the value. You might enter, for the previous example,

SYS 50768, 832, 895, -15536

So, if the number to be used is greater than 32767, then you must subtract 65536 from it and use that value.

If you want you can get the computer to work the value out for you. For example, this would achieve the same result as before

SYS 50768, 832, 895, 50000-65536

That's all there is to it!

Peter Thacker

## TDIR64

Got a tape with files on it but you don't know what files or where? Or perhaps you just want a neat printed listing of the files on the tape for your records.

TDIR64 (for Tape Directory Program for the Commodore 64) provides a catalogue of files on a tape. The output includes a user supplied identifier for the tape, the date, file names, type (program or data), the file size (in bytes) and optionally the tape counter at the start of the file.

The program asks you for the output device, Y = Printer, N = screen. Answer Y to the LOG TAPE COUNTER prompt to select that option. Up to 16 characters may be entered for the tape identifier. The date must be in an 8 character format.

The files open at line 300 opens the next file on tape. The name of the file is found starting at byte 5 in the tape buffer (lines 320 - 350). Bytes are numbered starting at 0. By PEEKing the tape buffer I found that programs are flagged by a 1 in byte 0 (line 510). Bytes 1 and 2 contain the program start address in low byte, high byte order (line 580). Bytes 3 and 4 contain the start of BASIC variables address (line 585). The difference is the program size (line 590). The size of data files is calculated by counting bytes (lines 540 - 560).

If the tape counter option is requested the program prompts the user to enter the counter. This is adjusted to allow for the first block containing the file name (lines 420 - 480).

The program loops (line 660) until the RUN/STOP key is pressed.

Lines 1000 - 8999 contain I/O subroutines.

## CHARACTER MAKER

After hours of using a pencil and paper to make up my user defined graphics I decided to make up a program to do the job for me.

Using the program is easy - use the numerical keys to fill in a pixel as a co-ordinate and use

the left arrow key and two co-ordinates to delete a pixel.

You may create your character by pressing F1 or use other features such as rolling the spike in four different directions or reversing the character and then creating the character.

## TINYGRAPH

In developing programs on the Commodore 64 there has been a need to use built in, and easy to use, graphics commands. Below is a short program that inserts itself into the BASIC interpreter and adds these commands. To make the program short and to provide one-key commands three unused keys on the keyboard have been used rather than tokenising three, more meaningful, graphics words.

The commands are: & border colour, screen colour – which will clear the screen and replace it with a high resolution screen ready for drawing; 'x1,y1,x2,y2,colour – will draw a line between (x1,y1) and (x2,y2) in the specified colour; ! border colour, screen, character – will replace the high-res screen by the normal text screen and the characters will be printed in the specified colour.

Each colour is a value from 0

to 15 and corresponds to colours that can be produced by the C64. For example 0 = black, 1 = white, 2 = red and so on (i.e. one less than the number on the number keys). Depending upon the screen colour, the line may not appear the colour that you wanted.

The co-ordinates that are allowed for the x and y values are 0 to 319 for x and 0 to 199 for y with (0,0) being in the top left hand corner – so essentially x measures how far horizontally you've gone and y how far vertically you've travelled. Should illegal values be used then the draw command will automatically return to the normal text screen and display an ILLEGAL QUANTITY ERROR message.

A word of warning. If some other part of your program has a fault that causes an error message to be printed when you are in the graphics mode, the screen will not revert back

to the text mode and a line of coloured squares will appear on the high-res screen in place of the message. You will have to manually restore the text screen by using the ! command.

All the values can be any legal BASIC expression and are not confined to simple numbers – except if the commands are used directly and not in a program (here they must be pure numbers). So, for example, in a program the colour code could be  $\text{SQR}(\text{LOG}(\text{PEEK}(24*1024)+1))$  but directly it must be 1 or 2 etc.

One other restriction is that, when used in programs, each of the commands must be preceded by a colon (:).

Program three shows examples of the use of these commands to draw lines, circles and to fill in regions.

To add these commands to BASIC type in the loader program (program one) exactly as

```

it is written and save it on tape or disk under the name **LOADER**. Type **RUN** and press return. The loader contains a checksum routine to prevent it from working if an error has been made - if this has happened then check each data statement again, save it and try again.

If everything goes to plan then the screen will clear and the name: **'TINYGRAPH BY P.THACKER'** will appear. You now have these three commands at your disposal. The **LOADER** takes a long time to **POKE** the instructions into the area of RAM located above the BASIC interpreter, at 49152, but there is a way to make it load almost instantaneously.

Here's what to do: **RUN** the **LOADER** (or follow the above instructions) and verify that it works; Type **SYS 64738** and press return. This restores the computer to its just turned on

condition without losing the graphics; Type

**POKE44,100:POKE 25600,0:NEW** and press return; Type in program two and save it on tape or disk; **RUN** it and if it's OK then the number 6471 will appear - if it doesn't then check the **DATA** statements again; Type **SYS 828** and press return.

Finally, make these changes to program two and **RUN** it again.

10 LOC = 2068

60 DATA 253,145,251

90 DATA 76,43,197

and a value of 6961 should appear. If not, check it. If all has gone to plan so far, type **POKE 44,0:NEW** and enter this one line program 10 **SYS 2068**. Now, to finish off, type **POKE 45,160:POKE 46,14:CLR** and press return. Now **SAVE** this program on disk or tape, under **"TINYGRAPH"**.

What you have done is

copied the graphics routines into the area used normally for your BASIC programs and joined onto it a small machine code program that will correctly reposition it. To use it just load **TINYGRAPH** as you would a normal BASIC program and type **RUN** and within a second you'll be off and running.

A brief comment about how the program works is important. The BASIC interpreter uses a subroutine located in zero page called the **CHRGET** routine to get the next character in any BASIC program. This routine is altered so that when one of the new commands is found the program you've just entered carries out the instructions required. When you load and run **TINYGRAPH** the bottom of BASIC is moved up from location 2048 to 16384 to make room for the 8192 bytes needed for the screen. If you're quick you'll notice that some 6K is unused (2048 to 8191) below the screen. This was done to avoid the character generator appearing on the screen.

**Peter Thacker**

## SCREEN PLOTTER

When you first enter the program and run it garbage will appear on the screen. Then it will start to clear itself slightly.

Then the screen will turn cyan and one little pixel will appear in the upper left of the screen.

This pixel can be moved around by: \*INSERT FIGURE 1.

If you wish to erase anything that you have drawn, press the E key, and your pixel will flash. If you now retrace any or all of your steps the pixels will be erased. This can also be used for moving your pixel without drawing.

To start drawing again press the D key.

If you wish to start again you can either press the HOME key or Run stop and Restore and rerun the program.

## DAYS TO GO

HEWLETT  
PACKARD

'How long to go till our holidays?', 'Only five weeks to Christmas!'. Days to go is a simple program - enter any two dates and it will list every day in between, giving you the days and weeks to go plus an optional column of percentages. The printout is an invaluable gift to someone getting married, expecting a baby or waiting for an important date to arrive. It occupies pride of place on many of my friends' toilet doors!

Written in Hewlett-Packard BASIC, there is little that would not work on most other BASICS-the DO/DOEND and IMAGE statements won't, but it should be obvious what they're doing.

The three date subroutines at lines 1000, 2000 and 3000 are not original. I've converted them from FORTRAN listings I've had for years. They are the sort of routine that most programmers need in their bag of tricks.

Phil Carter  
Warrnambool VIC

## BLOCKADE

Blockade is a two player game that demands sharp reflexes and skill.

It is a game like the light cycle scene in 'TRON'. The object of the game is to make your opponent crash into either the wall, his own trail or your trail.

Shaun Clarke  
Henley Beach SA

# MONOPOLY MANAGER

Here is a program that is not actually a game, rather it assists in playing the traditional board game of Monopoly. The screen displays the names and bank balances of up to six players and rolls the dice on screen when you hit the space bar.

After entering the program enter the name of each player. Then, roll the dice. Finally select which transaction you require and enter the requested information. The computer does the rest. If a player ends up with no money then he is declared bankrupt and no more data will be accepted for him.

If you wish to give each player more money to begin with alter the value of BB(N) in line 95.

**B.W. Madden**  
Surry Hills NSW

## MONOPOLY MANAGER

[illegible]

# ORIENTEER

Lost in the mystic northern forest!

Escape lies to the south but each step weakens you and the way is guarded by wolves, fierce lions, grizzly bears and evil ogres.

Beware of disappearing trees  
and above all else the ancient  
stone rings that transport the  
unwary to someplace in the  
north.

To travel north, south, east or west you simply press the corresponding N, S, E or W key.

Mapping the terrain is best achieved on 12 by 100 square grid paper. You start at the most north-west corner.

The terrain "wraps around" west and east, as does your monitor screen, therefore traveling east 12 moves puts you one move south.

The program although short used almost all BASIC memory on the 3.5K VIC-20 through use of the DIM statement that sets an integer array to contain the terrain information.

Please note – the underlined “Q” in line 4 is a cursor down which appears as a reverse “Q” on the screen.

**Peter Bagust**

# HI-RES SCREEN MACHINE CODE LOADER

This program sets up a 160 by 160 hi-res screen and incorporates a routine for plotting points on the screen. It is available for use with either BASIC or machine language routines. A 3K expander or Super Expander must be in place for use ones own basic programs.

To use the routines type in the program, run it, and then type NEW. The machine code is now in place beginning at 7296 (take care when typing in the data statements as an error

here may cause the program to crash later on). Basic programs can now be typed in as usual. Alternatively the above program could be incorporated inside a BASIC program.

To set up the hi-res screen use SYS 7296.

To plot points poke an X value into 7679 and a Y value into 7678 then use SYS 7394.

The value in 7677 determines whether the point is plotted or unplotted. A zero here causes

the point to be unplotted. A non-zero causes the point to be plotted. To clear whole screen use SYS 7361.

Note. If the points are to be plotted in a colour other than white then the screen must be filled with this colour after hi-res has been set up.

An example of how the routines might be used is given in the following program which plots the polar co-ordinates graph...R = SIN5J

```
10 FORJ=7296TO7465:READA:POKEJ,A:NEXT:POKE56,16:POKE55,0:POKE52,16:POKE51,0

100 DATA145,1,96,17,1,145,1,96,0,0
```

The next program demonstrates how a machine code program might use the routines. To run it load and run the hi-res screen program. Then load and run this program. Type SYS 7621 and a small cross will be

"bounced" around the screen in smooth hi-res motion.

This program can be run on an unexpanded VIC but any BASIC programs in memory will be lost. (POKE56,16 and POKE52,16) statements will

have to be changed to (POKE56,28 and POKE52,28) in the screen program.

## GALAXIAN 2

In this program the player has to shoot the alien before it invades. The player only gets one man but there are 100 possible levels (it is best to start at around level 5). As your score increases so does your level and it gets increasingly harder.

The alien will show itself for a random time (this decreases as the level goes up). The random statement in line 580 works out the cursor position for each stage down the screen. The random statement in line 620 keeps on generating numbers until it gets one lower than the present level. Between numbers being generated the player can enter commands

through the keyboard.

After an alien is shot, a new alien replaces it at the top of the screen.

The sound effects and PCG data were POKEd into memory.

The keys to use are 'L' for Left, 'R' for Right and 'Z' to Fire. Also to make the game easier and to stop the keyboard from getting too badly bashed I added the keys 'A' and ' ' to move to the far left and right of the screen respectively. The game goes on until the alien invades.

Peter Lutton  
Huon VIC

```

Solitaire is a program to simulate the IQ game of the same name. You have a board in the shape of a triangle with 15 pegs. You are asked which peg you would like to move. To move a peg you must nominate the number of the peg you wish to move and the number of the peg you wish it to jump over. The hole it will land in should be marked by an asterisk (showing it is empty). The aim of the game is to remove as many of the pegs as possible by jumping them with other pegs.

There is a delay of approximately 5-10 seconds while the computer checks if there are any other moves.

This program should be simple to convert to other basics knowing that:

CURS X,Y = PRINT AT or PRINT@;

CURS0 = moves the cursor to the top left hand corner without CLSing;

POKE 220,121 = removes cursor;

PLAY 8 = plays a note;

RESTORE X = restores data read pointer to line X;

UNDERLINE = underlines the text;

NORMAL = returns output to normal after UNDERLINE.

Keith Westley  
Girraween NSW

# SCREEN MASTER

Screen Master is a program I wrote that allows you to copy your normal screen onto your hidden screen, copy your hidden screen onto your first screen, and swap between the two. This is a fast and easy way to store and retrieve a second screen-full of information. The demonstration program shows some other applications in BASIC programs.

Although the program loads the machine language at memory location 1050 (Decimal) onwards, it can be placed anywhere in memory. The machine language routines are broken up into separate lines: 290 and 300: screen swapping data.

310: moves the normal screen onto the hidden screen.

320: moves the hidden screen onto the normal screen.

These three sets of data can be used individually or altogether using line 280 as a selector (as shown). After running the program try listing the program, then type USR(1050,2). Don't panic! Type USR(1050,2) again. After running the SCREEN MASTER program type in: J=USR(1050,0) to copy the normal screen onto hidden screen. J=USR(1050,1) to copy the hidden screen onto normal screen. J=USR(1050,2) to swap the two screens.

```

# CATCH

The object of the game is to catch as many asterisks as you can, by using the square brackets as controls (left and right respectively) to control your character, being the letter "t".

This program can easily be converted to run on other computers as the BASIC used is fairly universal, and quite simple.

# MICROBEE

## MEMSEE

The program, Memsee, is a monitor with a difference. It has no fancy commands, but it dumps 64 by 15 pieces of memory to the screen in ASCII code. It is like having a window on your computers memory, as it is continually updated. When you change a location or use certain BASIC commands you can instantly see the effect of it on the section of memory you are looking at.

Richard Larkin  
Dee Why NSW

```

This game is really only suitable for Microbees with the faster clock rate modification. Even so, it gives an example of the logic behind real time games on a memory mapped screen. The DATA statements define the PCG characters used for the maze and monsters etc.

Line 430 can be altered to allow input from a joystick at the parallel port. The maze can be redefined by changing the PRINT statements in lines 260 to 380 (GG = wall, CD = dot)

# NOUGHTS & CROSSES

The program is based on a series of 3 grids. The first grid is Player One, the second is Player Two and the final one is the overall status. For these I used the variables Q, C and A respectively.

Firstly, the two players are asked for their names and the game continues as a normal game of 'TIC-TAC-TOE'.

The program runs from line 1001 which branches to sub-

LIST

# MICROBEE

**FX**

Pattern draws patterns on the screen depending on the values you type in, and some nice FX can be created.

**Richard Larkin  
Dee Why NSW**

## NOVEL

Novel is a program that was written just for fun. Run the program and it will create a story from the yes/no questions you ask it. If the 'Bee decides the answer is 'NO' then the computer does nothing. If the answer is 'YES' then the question is changed in syntax to become the answer. The answer is then stored as part of a string array. To display the story, enter 'print' to the question input.

The program is a good demonstration of the Microbee's string handling abilities. The major part of it is dedicated to producing syntactically correct sentences. It isn't exactly perfect, but then I never was very good at English. There are a

few funny results produced and I'll leave it to the English deviated...ummm, orientated, to correct the program to process these little gloops.

The program waits for a question to be input. It then checks for a question mark at the end of the question. If that is correct, a check is made of the verb that sits at the beginning of the question. The list of verbs checked is from line 200 to 300. The list of verbs can be expanded on, just follow the format. Example:

```
200 A=SEARCH(AO$,"Is"):IF
A=1 THEN LET
AO$(4):GOSUB "is" 420:
GOTO 310
```

The string 'Is' is sought for in the input string. If it is in the list

character of the string then "Is" + a space is deleted from the string. That's the LET AO\$=AO\$(4). The GOSUB ('is')420 jumps to the routine to insert the verb back into the string AO\$ at the correct place so the question becomes a statement.

Lines 320 to 410 do the punctuation, set the first letter of the string to capital, decide whether the answer to the question is yea or nay and if yea then stick it at the end of an array string.

The last three lines of the program insert the verb in the correct place.

## PCG CHARACTER DESIGNER

This program is an expansion of the PCG Character designer which appeared in *Your Computer* some months ago.

Using that program, and finding the need for designing more than 1 character, I wrote this program to allow 3 characters to be designed at once, as well as adding some other features.

Because of the lack of space on the screen once the 3 - character grid has been drawn up, only one set of data can be put down the left side of the screen at a time, however this is not really seen as a problem.

One special addition to the program is a "Drawing" mode, activated by the letter "D". This automatically toggles the point when you move the cursor, making it easier to fill in large areas of the character(s). You can exit the drawing mode by pressing "D" again.

The control keys are as follows:

ESC: Move cursor up  
TAB: Move cursor down  
[: Move cursor left  
]: Move cursor right  
SPC: Toggle point  
R: Reset all data  
F: Set all data  
I: Invert all data  
H: home cursor  
1,2,3: Print data for each character  
SHFT + 1,2,3: Input data for each character  
D: Toggles in or out of drawing mode (Shown by a "D" at top of screen)

# WORM

This is a simple "Snake"-line game in Lores graphics for one person.

The object is to control a worm eating all the flashing frogs which appear on the screen. (Don't ask how the worm eats frogs, it just does!)

The only trouble is that if you crash into the wall, or yourself you are no longer alive.

You get points for just staying around, but more points for eating frogs. Eating frogs, however, causes you to grow, making the game more difficult.

The control keys for the game

are:  
ESC: Up  
TAB: Down  
[: LEFT  
]: RIGHT

At the beginning of the game, the program asks for speed. This is just a number from 0-255 giving the speed of the game.

One line has been omitted, and should be added to enable the high score function.

# MICROBEE

# SLOT MACHINE

You are in the midst of a packed casino with a 'one-arm bandit' in front of you; its jackpot steadily mounting. You insert the coin, your last one, and pull back on the handle (you really hit the / key but that spoils the fun!) and watch the shapes revolve. You hit the jackpot! Beauty! Shall you quit while you're ahead or go on gambling at the risk of going broke!

Some breath-taking sound effects and interesting characters add to the fun of this program which can become quite addictive.

Some points to note:

\* The characters do not actually revolve - they just appear to do so.

\* If you want a greater challenge then just increase the number of characters that appear in the game by altering lines 370, 420, 470, 540 and so on.

\* You can also alter these lines to change the characters that appear by altering lines 370, 420, 470, 540 and so on.

\* You can also alter these lines to change the characters that appear, if you find the ones I've chosen undesirable. To see the range of characters available, punch in: FOR X=0 TO 127:POKE 61440+(X\*2),X:NEXT X:END

# MASTERMIND

This game, written for the Microbee, is much the same as it's namesake. This version you can play by yourself or against a friend.

I will now issue a plea to anyone who can write a subroutine or program, in which the computer tries to guess the code, and send it in to this magazine. I'm afraid the maths is a bit beyond me! (OK, Hackers the race is on. If no-one comes up with one I'll publish an algorithm in a couple of months. EM.)

This program is very flexible for changing and converting to other computers. This is because it is only from line 350 to

line 900 that the most important information is processed. To convert therefore, is mainly a matter of changing variables and designing your screen layout (see the screen dump).

I recommend that you invent P.C.G characters to replace the plain looking letters. If you are the owner of that rare creature, the ColourBee, the use of colours for the code pegs would make this game visually much better. The game uses about 5K .... GOOD LUCK!

Greg Alcock,  
Oak Park, Vic

# KEYWORDS

This program allows words, commands or sequences of up to 15 characters in length to be typed repetitively with just two keystrokes. Twenty six words can be stored by typing TAB then the letter to store it under (ie. A to Z) followed by the char-

acters to be remembered and finally TAB again to mark the end.

To list all the words stored, type LINE FEED twice. (see Table 1.) To recall a word, type LINE FEED then the letter it was stored under. This will

greatly increase the speed of typing in a program under BASIC version 5.10.

Listing 1 shows the source code for a 32K Microbee. It can be changed for a 16K Microbee by replacing line 180 with ORG 3DOOH and reassembling. The

program is entered from Listing 2 which can be used for 16K or 32K Microbees. Once run this program can be cleared by typing NEW. The keyword will remain enabled even if the Microbee is warm reset.

```

Well, here's a game for the Microbee and yes, it is another variation on the old Star Trek game. The only difference is that I wrote it.

Just run the program. Once out of the menu, the game will begin. The commands are T for thrust, S for shields, F for torpedoes, D for display, C for computer, W for game save and X for self-destruct.

In the Thrust mode there are two choices, T for controlled thrust and N for hyperspace.

In the shield routine, T for transfer and S for shield status change.

Within shield change, F is forward, R is rear, P is port, S is starboard, U is shield up and D is shield down.

Cursor control for Computer direction/distance calculator 1 is

W=up, Z=down, A=left and S=right. A RETURN will exit cursor control and print co-ordinates of cursor position, direction of cursor from Viper and the distance. Another RETURN is then awaited before the command mode is entered.

There you have it. Any mistakes made will be prompted by an error message. It may be useful to place a CTRL G character at the end of every error message when typing the program in. This will get the player's attention if an error is made.

I have noticed that the energy for the Viper is usually insufficient. Try replacing  $A3 = RND * FLT(E) * 250 + 20000$  in line 350 by  $A\# = RND * FLT(E) * 400 + 20000$ . Have fun!

**Jon Barnett**

# MICROBEE

This program was written on the Microbee and uses less than 5K! Einstein II is a game of remembering sequences as they get longer and longer. The game has five levels of difficulty. There is a three second time delay for each keystroke so you must think quickly.

The program has some unnecessary documentation which you may want to omit. It appears after line 4000. Of course all 'REMS' should not be typed. If the four keys used on lines 580 to 610 (Y,U,G,H), prove to be awkward simply after them!

G. Adcock  
Oak Park NSW

# MICROBEE

## KEY CLICK

The program simply calls up a machine code routine every time a character is printed. This is a very useful program for typing or whenever a character is printed such as a BASIC error or listing a program. It will produce an audible signal for every character printed.

All the program does is print the relevant character for the

key pressed then produce a sound. To change the tone and length of the note alter the 90 in line 140 for length and the 20 for the tone.

I find it much better for typing to hear a nice sharp 'beep' rather than a 'clunk'.

Alistair Ferrier  
Coleraine Vic

```

```

# APF

## PASSWORD

This little routine discourages unauthorized activity.

On violation of this 'Password' sub-routine the singular features of the APF cause the keyboard to be disabled.

BREAK will terminate the audio alarm (Line 9030) but entry to the high resolution mode in this fashion (Line 9020) permanently locks out keyboard response. The only way out is to power down and re-load the program.

Obviously you would not use this approach unless you can retrieve from disc or tape what you were working on. The catastrophic effects of a password violation will permanently discourage fiddly fingers however!

```

```

You are flying a bomber over an enemy installation and your fuel is running low. You must try to land – and to do so must bomb most of the buildings below you that are in your way. If you hit a building your plane explodes, if you run out of fuel you crash. Beware of enemy gunfire as well.

The program uses the keys: A, Z and 1,2,3 (on the keypad only). If you want to generate your own landscape you must give the heights (1-9) of each of the 32 buildings. They are drawn as you go.

The machine program (given by the data) generates 16 bytes (which are stored in locations 32 to 47). If you record what happens when a particular key is pressed ( or a combination of keys!) you will find which bytes must be checked for different keys. (Note that the data given above is the first 17 bytes of the machine program given).

If you think that the game as given is too easy or hard then change line 420 to suit (that is, increase/decrease the number of clusters or forward fire left or the fuel allowed).

Peter Fallon

# SPIRO FOR MBASIC

Spiro is a program that draws patterns similar to those produced by the well-known 'Spirograph' game. It will draw all patterns that use two wheels, with the second wheel either inside or outside the first one. In addition, it allows the pen radius in the second wheel to be outside the circumference of the wheel.

It is written in Microsoft BASIC-80 (MBasic) but does not use any special commands, so should be easily portable. Like most Basics, MBasic does its transcendental functions in radians, so the program has a conversion function (ANGLE).

It uses only two commands in the plotter. 'MX,Y' means move to position X,Y and 'DX,Y' means draw a line from the current pen position to position X,Y. The pattern will be centered 600 units along the X and Y axes, but this can be changed with one line in the program.

```

10 REM SPIRO
20 CLS=CHR$(26):PRINT CLS$: CLEAR SCREEN
30 PRINT" This program draws circular patterns similar to those produced
40 PRINT"by the ";CHR$(34);"SPIROGRAPH";CHR$(34);" game. The plotting
   commands are
50 PRINT"suitable for the ROLAND DG DXY-100 and DXY-800 series of plotters.
70 PRINT"The program requires 5 items of input.
80 PRINT" 1. Large Circle Radius. This is the radius of the gear wheel that
90 PRINT" normally would be pinned to the drawing surface.
110 PRINT" 2. Small circle radius. This is the radius of the gear wheel
   into which
120 PRINT" the pen is inserted and which rolls around the circumference of
130 PRINT" the large circle. Despite the names, the small circle radius can
140 PRINT" be either smaller or larger than the large circle. For practical
150 PRINT" purposes the radius can be considered as the number of teeth
   in the
160 PRINT" circumference. Notice that the ratio of large circle radius to
170 PRINT" small circle radius determines the number of iterations needed
180 PRINT" before a pattern returns to its starting point.
190 PRINT" Note that the small circle radius can be negative. This means
200 PRINT" that the small circle rolls around an inside circumference. In
210 PRINT" this case the pen position radius must be less than the large
220 PRINT" circle radius.
230 PRINT"HIT ANY KEY TO CONTINUE";IS=INPUT$(1)
240 PRINT CLS$:
250 PRINT" 3. Pen position radius. This is the distance from the centre of the
260 PRINT" small circle at which the pen will be placed. This can be
   greater
270 PRINT" than the radius of the small circle, to create effects not
   possible
280 PRINT" with the original game.
290 PRINT" 4. Number of iterations. The number of times that the small
   circle is
300 PRINT" to complete a circuit of the large circle.
310 PRINT" 5. Initial offset. The angle by which the radius vector containing
320 PRINT" the pen is to be rotated from the x-axis (0 degrees) at
   the start
330 PRINT" of the plot. This is used in repeated patterns to 'walk'
   the whole
340 PRINT" pattern around. For single patterns, use 0.
350 PRINT:PRINT
390 PRINT"HIT ANY KEY TO START";IS=INPUT$(1)

1160 NEXT TH
1170 GOTO 400
1200 IF F=0 THEN LPRINT "M";X1;",";Y1 "MOVE TO (X1,Y1)
1210 F=1
1220 LPRINT "D";X1;",";Y1 "DRAW TO (X1,Y1)
1230 RETURN

```

Enhancements include changing the shape of the 'big' circle to an ellipse or some other function or inserting an auto-incrementing loop to rotate a pattern. It would also be possible to add another 'circle' to the structure. If R2 is the radius of this circle, then calculate SJ as for SI, but from R1 and R2, and then calculate QX and QY as for PX and PY.

The pattern here was produced with the sequences 250/50/250/1/0,250/50/150/1/0 and 250/50/50/1/0.

Jamboree Heights Qld

# PROGRAMS FOR TRS-80

# HANGMAN

Hangman should work on the Model I and, with small modifications, any other machine. The normal rules of hangman apply, however, if requested, there is a time limit applied to each guess. If a key is not pressed in time a move will be lost. As you win or lose the time limit changes to make it more difficult or easier.

Obviously many more words

can be introduced by simply adding more data lines, between lines 180 and 210. SE\$ contains the hidden word and DI\$ contains the displayed word, for example RA--I-. TI contains the time limit and its initial value can be altered by editing line 60.

# SHUFFLE

Here's a fun little program to keep you and your mind occupied on rainy Saturday afternoons or on that long business trip interstate. Written for the Model 100 TRS-80, it is a number-shuffle game which scrambles a line of digits and dares you to put them in their correct order. Ten digits are placed, in jumbled order, in a line. Your job is to 'shuffle' them by reversing part of the sequence, eventually to have all ten digits in the order 0123456789.

After enduring the title pages and introductory instructions (housed in the subroutine from line 260 onwards) you are greeted with a rather sparse screen holding only three pieces of data - a counter stat-

ing what move you are up to, the jumbled line of numbers and an input prompt asking you which digit you'd like to reverse from. When you enter a number between 1 and 10, the sequence from that number to the end is totally reversed. For example, if you enter 4 then the first four numbers will remain as they are and the rest of the line will reverse its sequence. If 7 was in position 4, it is now in position 10.

I hope you enjoy the program. You might like to improve it by adding letters in the sequence. Have fun!

LISTING 1  
=====
```

NOTE - \* REFERS TO A SPACE. THIS PROGRAM  
MUST BE TYPED EXACTLY AS IT IS SET OUT IN  
ORDER FOR IT TO WORK CORRECTLY!!!

An unbreakable, triple A secu-  
rity system for the Level 2 TRS-  
80 and System 80 computers.

Scramble your programs so  
that when they are loaded they  
cannot be executed without the  
correct passcode.

Firstly, type in or append your  
program to LISTING 1, begin-  
ning it at line 10. When you are  
ready to save your program,  
type RUN and enter three secu-  
rity numbers. THE SCRAM-  
BLER will go to work, encrypt-  
ing everything beyond line 9.  
This can then be CSAVED with-  
out any fear of someone else  
running or listing it.

When you decide to work on  
your program next, load and run  
it and then enter the same three  
numbers. Your program will be  
decoded back to its original  
state.

There are 125,000 different  
combinations so it is highly un-  
likely that anyone who doesn't  
know your numbers can crack  
it. But, don't forget the numbers  
since if even one of the num-  
bers is slightly out, the decoding  
will make your program even  
more obscure. Line 0: This is  
free so you can enter - 0  
GOTO 10. Typing this will make  
sure your program is not en-  
coded while you are debugging  
your program. To scramble your  
program, just delete 0.

Robert Young  
Thornlie WA

# WAGES, SALARIES, TAX & APPORTIONMENTS

This program can be adapted to any small business where staff and materials are involved. Names of employees and hourly rates of pay can be easily changed. If there are less than ten employees enter zeros or merely press the ENTER key. If there are more than ten, then alter the appropriate lines i.e. 2000 FOR N1 to 10 etc. Names, amounts and descriptions can be altered at will provided the rules of syntax are observed. To run the program as

it stands it is only necessary to enter the number of hours worked in each category as the computer asks for them, enter zero or pass. However in the apportionments a careful assessment of percentages should be made and the total must be 100 per cent. Where no work is carried out a zero must be entered.

Upon running this program you will be asked two questions: "what is the total amount allocated for this project?" and;

\$2 =	2 CENT = 1
\$1 =	1 CENT = 1
\$ 3558	\$ 5.37

"what percentage do you wish to allow for labour?". Materials are not considered in this program. Allowance for this should be made when setting the percentage for labour.

Here is a test submission for the Wages or Salaries, Tax and Apportionments program which produced the printed tables.

Total cost of the Project (including materials) \$25,000 Percentage for labour 72 per cent.

Hours, Categories, Wages, are produced from this in-put.

1. Fisher John. Labourer 80 hours
2. Arthur James. Labourer 48, Quarryman 32 hours
3. Ives Simon. Labourer 80 hours
4. Steed Paul. Labourer 54 Quarryman 26 hours
5. Day Terrence. Quarryman 56 Hammer & Drill 24 hours
6. Williams A.B. Quarryman 56 Hammer & Drill 12 Scoopman 12 hours
7. Arkwright J. Labourer 56 Carpenter 24 hours
8. Johnson S. Truck-driver 48 Grader-driver 32 hours
9. Amos Carl. Powder-monkey 12 Foreman 72 hours
10. Tredos Erica. Secretary 80 hours

Percentages allotted to each section (in both instances)

1. Clearing 10%
2. Earthworks 35%
3. Drainage 5%
4. Culverts 12%
5. Formation 8%
6. Surfacing 30%

Total labour cost \$17,775.00 materials \$ 7,000.00 reserve \$ 225.00

Note: There is rather a long pause after entering the Employee's hours of work. This is due to the number of calculations to be worked out at this stage. In the third repeat of the program on the cassette this has been taken care of with a suitable explanation which is not on the print-out.

A - This is LPV11's print-out. Actually the screen is filled (full) to the last line.

# CLUEDO

User Machine: TRS-80 Level II - uses 14K. Designed for Mod 1 but will run on Mod III - 32K upwards but you must delete the Mem Size pokes in Line 1. Disk systems without DOS boosted. Operates with or without L/C installed.

Development: Originally the program was written entirely in Basic but the computer used to take about 40 seconds after each player's turn to scan possibilities and store and retrieve information from previous calls.

This was unacceptable so I delved into assembler for a while and the resultant machine code allows for very fast turnaround. If someone wants to disassemble it, it resides from 7273H to 74D3H.

Alan Goodison  
Mooroopna Vic

## STOCKMARKET

Stockmarket is a game I wrote a few months ago.

Lines	Function
10-300	Introduction
310-450	Displays table
550-660	Buying shares
670-720	Buying more shares
750-1180	Select a change in trends
1190-1210	Print it
1220-1370	Sell shares
1380-1470	Assign values for graph
1480-1670	Graph routine
1680-1730	Find status (up/down)
1740-1900	Quit routine

This simulation is designed for the System 80/TRS-80 machines and uses PRINT@ and PRINTUSING otherwise I see no problems in conversion to other machines. The program runs on a 64 character screen and occupies about 9K.

David Thomas  
Yandina Qld

# CADDYSHACK

Caddyshack is a simple golf-playing routine. The player swings or putts by entering numbers, which then become the stroke lengths. The ball lands somewhere else on the green; if you've estimated your swing well enough it will land in the cup and you stroll on to the next hole. A running score is kept up throughout the play, and presented regularly.

Much can be done to improve the program. For a start, it's not noisy enough. The 'goodbye' routine (lines 470 to 500 inclusive) uses sound, certainly, but the WIN routine could do with a bit of racket. Try this: 380 FOR WIN=0 TO 9: GOSUB 520 520 FOR NOISE=600 TO 750

STEP 5: SOUND NOISE,2: NEXT NOISE: RETURN

You might like the machine to sound a beep at the beginning of each hole – just add this to line 20: 20 FOR HOLE=1 TO 9: BEEP

You might like to change the PAUSE values.

Use is made throughout the program of the delay subroutine at line 510. Note how the delay value, PAUSE, is set at the subroutine calls, so that the length varies at each call. Thus, the delay initiated at line 400 will run fifty times, while the pause at line 490 will be two hundred runs long.

Alien wipeout is another of the 'shoot-em-up' type games for the TRS80/SYSTEM 80. It requires approximately 7K and (with minor modifications) will run on both 16K and disk based machines, the listing here being the 16K version. The game itself is pretty self explanatory but here are a few hints which might make you a better player:

1. The aliens fuel store is located at the left uppermost point on the aliens ship and getting this point within your sights will certainly destroy the alien. If you hit the alien anywhere other than this point the impact will only cause minor damage.

2. 'Warping' from one side of the screen to the other disrupts your firing and your viewfinder. Although you might think you hit the alien when in this position it is quite possible that the unusual space time continuum of hyperspace will have absorbed your shot.

3. When the situation arises that the alien is on the opposite side of the screen don't waste your precious seconds by heading straight for him. Instead 'warp' from one side of the screen to the other and you will usually be able to catch him faster. Although this is a simple and quite obvious procedure I have included it among your hints for the simple reason that it is incredibly easy to forget in the heat of battle!

Finally for those of you who have disk based systems please note the following modifications to the program.

Line 80: Insert a CMD"T": in front of the CLEAR command.

Line 240: Replace the POKE16396,175 with CMD"BREAK.N" (or the equivalent command for your DOS)  
Line 970: Replace the POKE16396,201:END with CMD"S"  
Line 990: Replace the POKE16526,62:POKE16527,64 with

DEFUSR0=16446

DEFUS

Lines 1010-1120: Replace all USR(0)'s with USR0(0)

# PROGRAMS FOR SHARP

# TEXT EDITOR

## (For Sharp PC-1500, Tandy PC-2)

All colours may be selected and provision for text input which exceeds the maximum line length has been made in the following manner:

Text is input at line 130 of the program and lines 150-190 test the length of variable A\$(0) in relation to the size of lettering in use. They transfer control to line 300 if the text exceeds the maximum characters allowable for the selected size.

The program then requests a change of letter size, or amendment of text. It is then displayed on the screen, with the excess characters in brackets.

Lines 11 to 16 may be deleted when the user is familiar with the program use. The rotate command enables printing downwards and that section of the program may be removed if not required.

The program is extremely simple to use, and owners will need only spend a minimum of time to become familiar with it.

# PRIME NUMBERS

(For Sharp PC-1500)

After trying the Benchmark Prime Number test and recording an earthshattering 4520 sec on a Sharp 1500 I feel that I cannot seriously take up the speed challenge a *Your Computer* correspondent put out in a recent issue. However I am able to comment on improvements that enabled me to reduce the time taken to 84 sec.

My first thoughts were to improve the program along the following lines:- That trail di-

visors need only be primes greater than the square root of the number being tested.

That even numbers can be omitted from the routine altogether.

This reduced the time to a more respectable 432 sec.

At this point I remembered a procedure usually taught to year 7 pupils called the Sieve of Eratosthenes (also a major benchmark for computers, Ed.). The enclosed listing is the result. If

a similar improvement is possible for other machines then I would expect to see a time of 1 sec.

The program sets up a matrix of 1000 elements, then sets up a table of primes greater than 32. Odd composite numbers are then eliminated by repeated addition. Printing is carried out in a loop. After all, the challenge did not say that you had to be able to read them!

# MACHINE CODE MONITOR

(For Sharp PC-1500)

Minimum System: PC-1500 with 8K RAM and cassette interface/printer.

Recommended Reference: Sharp PC-1500 Pocket Computer Technical Reference Manual.

Pocket Monitor is a basic

machine code monitor for the Sharp PC-1500 computer. It includes facilities to examine and/or change memory contents, printout the contents of specific areas of memory, run machine code programs and set or examine some of the

CPU registers before, or after, running a machine code program.

The program is controlled by selecting the required function from a six item menu using the function keys.

S. Corrigan  
Lawson NSW

# FRUIT MACHINE

(For Sharp MZ-700)

Here is a good program for beginners like me, because it incorporates sound and colour and is a lot of fun to play.

Allan Moss  
Duffy ACT

```
THIS IS A $.50 SLOT MACHINE.
PAYOFF IS $3.00 FOR 3 CHERRIES, 3 LEMONS
, OR 3 ORANGES.
ALL OTHER COMBINATIONS LOSE.
HOW MANY 50-CENT PIECES DO YOU WANT TO U
SE IN PLAY.
? 4
YOU START WITH $ 2
```

```
DO YOU WISH TO PLAY (TYPE 1 FOR YES, 0 F
OR NO)? 1
```

```
LEMON LEMON LEMON
```

```
GREAT YOU WON $3.
```

```
YOU NOW HAVE $ 5
```

```
DO YOU WISH TO PLAY (TYPE 1 FOR YES, 0 F
OR NO)? 1
```

```
CHERRY CHERRY CHERRY
```

```
GREAT YOU WON $3.
```

```
YOU NOW HAVE $ 8
```

```
DO YOU WISH TO PLAY (TYPE 1 FOR YES, 0 F
OR NO)? 1
```

```
CHERRY ORANGE ORANGE
TO BAD - - YOU LOST $.50.
```

```
YOU NOW HAVE $ 7.5
```

```
DO YOU WISH TO PLAY (TYPE 1 FOR YES, 0 F
OR NO)? 1
```

```
ORANGE ORANGE CHERRY
TO BAD - - YOU LOST $.50.
```

```
YOU NOW HAVE $ 7
```

```
DO YOU WISH TO PLAY (TYPE 1 FOR YES, 0 F
OR NO)? 1
```

```
LEMON ORANGE CHERRY
TO BAD - - YOU LOST $.50
```

```
YOU NOW HAVE $ 6.5
```

```
DO YOU WISH TO PLAY (TYPE 1 FOR YES, 0 F

  ,1)+N$:N=A:
  RETURN

```

## ESCAPE

(For Sharp PC-1401)

To play ESCAPE just type RUN and press ENTER. A prompt will ask you for the size of the Maze. The computer will then be busy while it generates the new Maze. The computer will beep twice when the maze is completed.

During play the computer will display the available exits open to you, these will be any combination of N(orth), E(ast), W(est), or S(outh) inside square brackets. Just press the key of the compass point of the direction you wish to move.

The computer can generate a maze with one-way walls and rooms with no exits.

'YOU ARE TRAPPED!' is displayed when in a room of no exits, pressing 'X' will take you back to the start of the maze.

'FREE AT LAST' and your score (maximum is 1000) will be displayed when you find your way out of the maze.

David Green  
Shailer Park QLD

# PROGRAMS FOR VZ200

# GOLF SIMULATION

This draws a golf course in graphics mode with endless variations on bunkers, water hazards and roughs, and allows the player to actually 'play' the shots giving a choice of club, hitting strength and direction.

Gary McCleary  
Emu Plains NSW

```

## KNIGHTS CROSS

The program is purely graphics and works as follows:  
Line 16 sets random colour.

Lines 30-60 creates what I call an inverted German Cross in multi colours.

Lines 90-200 draw a circle in the cross.

Lines 345-370 draw a square.

Line 370 pauses to display the image.

The end result looks like the 'Knights Cross with oak leaves' just like the Germans issued their war heroes.

It shows how we can use the capabilities of the VZ200 todraw very intricate designs by allowing the composition and placement of the A Z Y in the lines 40-43 and 100-170, i.e. A+60 change to A-60 or A+60, 30+Y change to 30-Y, A-60 all sorts of wonderful patterns can be created.

# PROGRAMS FOR SINCLAIR

# GRAND PRIX

(For ZX81, 1K)

Grand Prix involves driving your racing car (an inverse 'H') down a convincing simulation of a racing course, while dodging other cars and people who are cleverly disguised. The object of the game is to last as long as possible.

The keys '5' and '8' move you left and right. There is a high score feature and, after a game, press any key to play again.

This program uses a number of unusual techniques. First of all, it uses a bit of machine code POKEd onto the first REM statement to speed things up. When called (by USR 16514), it returns a code relating to the character in the correct PRINT position. This replaces the line: PEEK (PEEK 16398 + 256 \* PEEK 16399)

Also, in my article, 'Larger Screen' in Your Computer July

1983 issue, POKE 16418,0 was used to obtain a 24 line screen. This location can also be used to make the screen smaller, and so save memory.

POKE 16418,5 would change the screen to 32 by 18 lines - PRINT AT 19,0;"Jason" would result in an out of screen error report. The SCROLL command is also changed to work from this line.

The scoring is also unusual, since the line NEXT S is used instead of the line LET S=S+1 which uses up more memory and is slower.

In the listing, Δ is a space and 'gr.A' means the graphic character on that key.

My best score is 413. Can you beat that?

Jason Teh  
Doncaster VIC

```

1 REM 0000000
POKE 16514,42
POKE 16515,14
POKE 16516,64
POKE 16517,78
POKE 16518,6
POKE 16519,0
POKE 16520,201
2 POKE VAL "16418", VAL "5"
10 LET H=NOT PI
20 LET A=VAL "8"
30 LET B=VAL "5"
40 CLS
50 LET D=INT PI
60 FOR S=0 TO 10
70 SCROLL
80 PRINT TAB D; "inverse space, gr. A, gr. A,
  gr. A, inverse space"
90 IF RND>.7 THEN PRINT AT 18,D+RND*2+1; "gr. S"
100 NEXT S
110 LET B=B-(INKEY$="5")+(INKEY$="8")
120 PRINT AT A,B;
130 IF USR 16514>CODE "gr. A" THEN GOTO 180
140 PRINT "inverse H"

190 IF H<S THEN LET H=S
200 PRINT "S=";S;"ΔΔinverse H=";H
210 PAUSE VAL "4E4"
220 GOTO VAL "20"

```

ENTER DIRECTLY ON THE KEYBOARD.

# ASTEROID DODGE

(for ZX81, 1K)

Asteroid Dodge is an addictive game for the 1K ZX81. The aim is to safely pilot your ship through space dodging the asteroids hurtling towards you.

Your ship is always moving left and cannot stay still. Pressing any key will move you right. Also, if you move too far to the side of the screen, your ship will disappear and appear on the other side, which makes the game harder.

There is a high score and scoring mechanism. At the end of a game, just press any key to restart. Also, the game uses a short machine code routine POKEd onto a REM statement to speed things up. When called, the code value of the character in the current PRINT position is returned.

Have fun!!!

## ESCAPE

(For ZX81, 16K)

Here's a short program — a game which starts easy and as you progress becomes more difficult.

The object of the game is to dodge the black squares and to travel through the time gate which appears at random. If you do make it, more black squares appear randomly. Your score goes by steps of your input and rounds go up by one every time you reach the other side. Skill is obtained by score, rounds and level. To move your star use the keys A for up and Z for down.

Garry Wilson  
Higgins ACT

```

## ZX81 SKETCH

(For ZX81, 1K)

There are many 'drawing' programs for the ZX81, but many are wasteful of memory. While this is alright for a 16K ZX81 1K owners are much disadvantaged. I have sought to remedy this, and have produced "Sketch" for the 1K ZX81, using the PLOT command to get a resolution of 40 by 40.

There are 8 directions in which you can move and you can rubout as well as draw. The key directions are with the listing.

To get into DRAW mode, press '9' and to RUBOUT, press '0'. If you own a 16K ZX81, change and add the extra lines. You now have some bonus commands as well as a resolution of 64 by 44. Pressing 'Z' will dump the screen to the printer, and will let you continue drawing. 'C' will now clear the screen. Finally, pressing 'S' will SAVE the screen and the program onto tape, and will let you continue drawing the same picture at a later date. Before pressing 'S', make sure the tape recorder is recording!!

Jason Teh  
Doncaster VIC

```
10 LET Z=1
20 LET X=0
30 LET Y=40
40 LET A$=INKEY$
50 IF A$="0" THEN LET Z=-Z
60 LET X=X+(A$="8" OR A$="1" OR A$="2")-
  (A$="5" OR A$="3" OR A$="4")
70 LET Y=Y+(A$="7" OR A$="1" OR A$="4")-
  (A$="6" OR A$="2" OR A$="3")
80 LET X=X+(X<0)-(X>40)
90 LET Y=Y+(Y<0)-(Y>40)
100 UNPLOT X,Y
110 PLOT X,Y
120 IF Z=1 THEN UNPLOT X,Y
130 GOTO 40
```

If you own a 16k ZX81, change and add the following:

```
80 LET X=X+(X<0)-(X>63)
90 LET Y=Y+(Y<0)-(Y>43)
130 IF A$="Z" THEN COPY
140 IF A$="C" THEN CLS
150 IF A$="S" THEN SAVE "SKETCH"
160 GOTO 40
```

KEY DIRECTIONS --

# ATTR FILL

## (For Spectrum)

This program is for a ZX Spectrum with any memory size. One annoying fact that I find when using the Spectrum is that if you want the PAPER, INK, FLASH or BRIGHT commands to work globally (the whole screen), you have to clear the screen first with CLS and so destroy the display, which might have taken a long time to set up. To overcome this, I have written a short machine code routine, only 18 bytes long, which changes the screen instantly without clearing the screen.

To use it, just enter the appropriate colour commands such as: PAPER 6: INK 1: FLASH 1 and call the routine. The whole screen should then become yellow, with blue lettering and everything flashing. The screen displays will still be there.

You can also do this by POKING the attribute number into address 23693, which in this case would be 177, and then calling the routine.

There are two parts to the listing. The first POKES the machine code stored in a DATA statement, above RAMTOP and the second is a demonstration program.

As listed, the program is for a 16K Spectrum but to change it for a 48K Spectrum, change every address 32582 to 65349 and every 32583 to 65350. You call the routine by LET L=USR 32583 - 16K or LET L=USR 65350 - 48K.

First type in Listing 1 and RUN it. Save the code by SAVE "ATTR FILL" CODE 32583,18 and VERIFY it. NEW the machine and type in the demonstration program. Remember to CLEAR 32582 before LOADING.

Jason Teh  
Doncaster Vic

Demonstration.

```

10 CLEAR 32582: LET X=32582
20 FOR N=X+1 TO X+18
30 READ A: POKE N,A
40 NEXT N
50 DATA 33,0,88,1,192,90,58,141,92,119,
    35,167,237,66,9,32,248,201
60 LET L=USR 32583
70 PAUSE 10
80 NEXT N
90 GOTO 40
    
```

# CHEMISTRY

## (For ZX81, 1K)

This program tests your knowledge of the first ten chemical elements. Run the program and the computer will randomly print the name of one of the elements and asks you to input the atomic number and then the symbol for that element. The computer will tell you whether your answers are correct or will give you the correct answer.

# SIGMAOKI

## BLACK BOX

My program is a variation of the game 'Black Box' invented by Dr. Eric Solomon. It is a game of logic that can easily be converted to run on a Peach because the two machines are virtually identical.

The object of black box is to find four protons in a box. The paths of electrons shot into the

box give the clues. Because the red light emission of the electron is only temporary it becomes necessary to have a working space to put down your ideas. This is provided in the form of a second board, disconnected from play.

The number of shots you have used to find the correct

# WORD COUNT FOR HITACHI PEACH

Phillip Cookson  
Doveton NSW

After reading Les Bell's "Understanding Assembler" tutorial in the October 1983 issue of "Your Computer", I was inspired to write a BASIC program to count the words in a

word processing data file (Les suggested to write a word counting program in a higher level language before attempting a machine code version). The program is written in Micro-

soft BASIC. Although the program is slow, it works correctly and will be of use to anyone who uses the HiWriter word processing software. The program performs a word count of

a text file created by HiWriter (which currently has no facility for performing a word count). It ignores embedded format commands and remarks giving an accurate word count.

```
100 ' WORD COUNT      By Philip Cookson      November, 1983
110 '
120 ' This program performs a word count on a data file created by the
130 ' HiWriter word processing package. Words are defined to be groups
140 ' of letters A-Z or a-z separated by spaces or by a carriage return.
150 ' This program ignores control characters, or words appearing on an
160 ' @ command line.

# CAMEL FOR CASIO PB-100

The game 'Camel' is originally from the book 'Basic Computer Games' by David Ahl, although this version was written on a train trip between northern NSW and Sydney.

The aim of the game is to travel 200 miles across a hostile desert while the pygmies are chasing you. In order to fit it into a PC-100 with the RAM pack (it takes 1399 steps) the messages have been abbreviated. For example:

L. 120 - distance pygmies are behind;

L. 130 - distance you have travelled;

L. 610 - turns you can go without a drink;

L. 600 - number of days the camel can travel without a rest.

The instructions have been included so they may be written down if necessary before you play.

The display frequently halts

and the EXEC key must be hit to continue (this is faster than letting it print out long messages on its own).

During the course of the game, variables, such as drinks left or camel days left, will vary according to your instructions so a STATUS CHECK (5) will indicate whether it is necessary to stop for the night or take a drink.

Variables used are:

C...distance covered by the player

D...distance covered by the pygmies

Z...turns you can go without a drink

S...number of drinks left

F...camel days' left

G...skill level

Y...command choice

P & R are used as counters.

Linda McGarry

# Ohio HIGH-SPEED TRIGONOMETRIC FUNCTIONS

This is a program for Forth on the Ohio Scientific Computers, but the programs are designed to operate on any Forth machine. The program provides high speed trig functions for real time applications.

It is possible to obtain trig functions from the floating point system used by BASIC in ROM but these routines are slow when needed for real time plotting of graphical information.

These programs provide a source of values for Sine x to plot circles in real time.

The routine is called using: 'n SIN' where n is a signed integer number on the top of the stack. It returns a signed integer number to the stack. This value is SIN n degrees times 10,000. Values for Cosine are obtained in a similar manner, that is, 'n COS'.

John Lindsay  
Trinity Gardens SA

## MEMORY TESTER FOR CASIO FX-702P

This is a fairly simple Memory Test game in which the computer generates an increasingly large random number (displayed on the screen for an increasingly large period of time) which you, after a ten second pause, have to input back. The computer allows you three tries to input the correct number, but three 'strikes' and you're out.

# Computers in Schools

**AT LAST! A  
PUBLICATION FOR  
TEACHERS, PARENTS,  
STUDENTS ... AND  
ANYONE CONCERNED  
WITH THIS VERY  
IMPORTANT ISSUE.**

## ISSUES:

### *Does your child really need a home computer?*

It's become rather difficult to see through all the media hype! We provide down-to-earth answers to major questions (Will your child be handicapped without a computer? Or even handicapped by one?)

### *The push into the schools market*

An impartial look at the wave of advertising power currently breaking over the (supposedly) lucrative schools market. Who really stands to gain — the kids, or computer manufacturers?

## VIEWPOINTS:

### *What the experts say*

Recognised authorities in the fields of both education and computing give their opinions.

### *How the teachers feel*

Computers are likely to feature strongly in the future of education. We tell how teaching staff are coming to grips with this fact.

### *What the kids think*

Are computers worthwhile? Just good fun? Or a waste of time? Students comment (candidly) on how they feel about computer education.

## PRACTICALITIES:

### *How to pick the right system*

For high schools, primary schools.

### *Educational software*

What's available; what's really educational; what to look for when shopping.

### *Networking and schools*

What it is; how it works; how it can help.

### *Computer aided education in practice*

Getting right down to basics: how are computers actually used in the schoolroom?

*Computers in administration.* The out-of-the-classroom aspect. How computers can streamline the behind-scenes running of a school.

## CASE HISTORIES:

### *The UK scene*

How far has computer education advanced overseas? And how far will it go?

### *True-life stories*

From schools around Australia — how computers are working for them.

*All this, plus a useful  
directory of services, and  
a simple-language  
glossary to help you in  
your purchase of a  
computer.*

**AVAILABLE JANUARY, 1985**

# COMPUTER CLUB LIST

## ACT

**ACT Micro 80 Users Group**, Bill Cushing, 10 Urambi Village, Kambah, 2902, 062 313630.

**ACT Vic 20 Users Association**, Chris Groenhout, 25 Kerferd St, Watson, 2602, 062 41 2316, Meetings 1st Monday each month at Boy's Grammar Scout Hall, Red Hill, 7.30 onwards.

**ACTARI**, Chris McEwan, Co-Ordinator, ACTARI, P.O. Box E112, Canberra, 2600, 062 88 7861.

**Apple User Group (ACT)**, Jeff Brock, 1 Buckley Circuit, KAMBAH, 2902, 062 313630.

**Australian ZX80 Users Group (AZUG)**, David Brudenall, 19 Godfrey Street, Campbell,

2601, for ZX80/Microace owners.

**Canberra ACT Sirius User Group**, Jim Bland, 062 81 2824, 062 81 2832.

**Canberra Compucolor Club (CCC)**, Meets 7.30 on first Sunday of every month at the offices of Digital Equipment, 28 Lonsdale Street, Braddon ACT.

**Canberra Microbee Users Group**, Hugh Gibson, Microbee Store, Level 1, Cooleman Court, Weston, 2611, 062 88 6384.

**Canberra Microbee Users Group**, Adrian Van Wierst, 9 McGowan Street, Dickson, 062 49 7030.

**Canberra Micro-80 User Group**,

Milt Cottey, 33 Crawford Cres, Flynn, 2615, 062 58 8822, meetings third Monday each month 7.30 pm in the small theatre, Reid TAFE, for System 80, TRS-80 etc.

**Canberra NEC Users Group**, Mal Smith, PO Box 173, Belconnen 2616, meets first Tuesday each month at Main Conference Room, CSIRO Headquarters, Limestone Avenue at 7.30, (062) 54 1614.

**Canberra Osborne Group**, c/o Geoff Cohen, P.O. Box 136, Kippax, 2615, 062 54 7608.

**Micsig**, Registrar, P.O. Box 446, Canberra, 2601.

## NT

**Alice Springs Microbee Users Group**, Douglas Craigie, c/- PO Box 3230, Alice Springs 5750.

**Darwin Microbee Users Group DBUG**, Felino Molina, P.O. Box 3111, DARWIN, 5794, 089 82 5613bh, 089 88 1455ah.

**N.T. Computer Club**, Ian Diss,

meets at Wulagi Primary School on the first and third Thursday of each month at 7.30. Users of all machines and other interested parties welcome, (089) 27 9208.

**N.T. 80 Computer User Group**, R T O'Brien, 433 McMillans

Road, JINGILI, DARWIN, 5792.

**The Microcomputer Assoc. of the N.T.**, Andy Smith, Darwin Community College, CASUARINA, 5792.

**VZ-200 Users Club**, 7 Abbott Crescent, Malak, Darwin 5793, (089) 272830.

## SA

**AACC, Adelaide Atari Computer Club**, meets at Gilles Street Primary School, City, on first Monday (second if first is on Public Holiday) of each month. Secretary, PO Box 333, Norwood, SA 5067.

**Adelaide Lotus 1-2-3 User Group**, Paul Wragg, Pannell Kerr Foster, GPO Box 1969, Adelaide.

**Adelaide Micro User Group**, R. G. Stevenson, 36 Sturt Street, Adelaide, 5000, for TRS-80 and System 80 Users.

**Adelaide Osborne Group**, Russell Barter, The Secretary, 410 Regency Road, PROSPECT, 5082.

**Beebnet, BBC and Econet User Group** P.O. Box 262, KINGSWOOD, 5062, The group intends to produce a newsletter on a monthly basis. It is interested in any software producers or distributors who would be interested in serving the groups market requirements.

**Commodore/Vic Computer Users Assoc.**, Mr Eddie Hann, 13 Miranda Road, PARALOWIE, 5108, The SA branch meets

monthly.

**Compucolor-Intecolor User of S.A.**, P.O. Box 86, Torrensville, 5031, 08 352 3296.

**DEC Personal Computer Special Interest Group**, see NSW entry.

**IBM-PC S.A. Users' Group**, PO Box 68, Walkerville 5081.

**Kaypro User Group**, Myles Wakeham, 100 Pirie Street, Adelaide, 5000, 08 223 6333, meetings 1st Tuesday each month.

**Microbee Users Group of S.A. MUGSA**, The Secretary, GPO Box 767, Adelaide 5001.

**S.A. Commodore Computers U.G.**, Eddie Hann, The Secretary, P.O. Box 427, North Adelaide, 5006, 258 6367, meetings second Tuesday each month, 7.30 at Royal Caledonian Hall, 379 King William St, Adelaide.

**S.A. Foundation for Computer Literacy**, Michael Kennett, PO Box 210, Norwood 5067, caters for children from 6 years (unaccompanied) or 4 years with older friend or brother or sister. Special emphasis on the needs of hand-

icapped, and educably disabled and socially disadvantaged children, but ALL children welcome. Family participation encouraged, phone (08) 51 5474.

**S.A. Peach User Group**, Geoff Drury, 27 Creslin Tce, Camden Park 5038, (08) 352 2555 or 295 2778 (ah), special interest group attached to the SA Microprocessor Group which holds separate meetings.

**S.A. Microprocessor Group Inc SAMG**, The Secretary, P.O. Box 113, Plympton, 5038, 08 278 7288.

**Sorcerer Users Group of S.A.**, Don Ide, 14 Scott Road, Newton 5074.

**South Australian Apple Users Club**, The Secretary, SAAUC, C/- The Bookshelf, 169 Pirie Street, Adelaide, 5000.

**South East Computer Enthusiasts' Group**, Glenn Mibus, 3 Millard St, Mount Gambier 5290, 087 25 1046, meetings 2nd and 4th Tuesday of each month from 6.30 at Mt Gambier High School Computer Room, for all machines and interested parties.

# COMPUTER CLUB LIST

## NSW

**Albury-Wodonga Dist Mbee U.G.**, Eric Eulenstein, 202 Kooba St, Albury, 2640, 060 25 1601.

**Apple Users Disk Exchange Club**, Peter Lopic, 45 Malabar Street, Canley Vale 2166.

**Apple Users Group**, Colin Rutherford, P.O. Box 505, Bankstown, 2200, meets 6.30 pm second Monday of each month (Tue after pub. hol.) at Sydney Grammar School, Stanley Street, Sydney, 02 520 0926.

**Atari Computer Enthusiasts**, Tony Reeve, PO Box 4514, Sydney 2001.

**Ausborne**, Brian Carney, 477 4492, P.O. Box C530 Clarence Street, Sydney, 2001, meetings third Wednesday each month at 6.30 in the North Shore Council Chambers, for Osborne users.

**Ausbug**, Stephen Ford, P.O. Box 62, Londonderry, 2753.

**Australasia ZX80 Users Group**, Tony Mowbray, 87 Murphys Ave, Kieraville, 2500, 042 28 5296, for ZX80/81 Microace owners.

**Australasian ZX80 Users Newsletter**, 87 Murphys Ave, Kieraville, 2500.

**Blue Mountains Microbee Computer Club**, Roger Cooper, 047 58 7238.

**Blue Mountains Computer Club**, Eric Lindsay or T. Macindoe, C/- P.O. Faulconbridge, 2776.

**Broken Hill Microbee Users Group**, Peter Cotter, 533 Radium Street, Broken Hill, 080 881621.

**Central Coast Apple Users Group**, C.W. Lee, 662 The Entrance Road, Wamberal 2260, meetings first Tuesday each month at the Niagara Park Public School from 7.30 pm, (043) 84 3419.

**Central Coast Computer Club**, Max Maughen, P.O. Box 36, Et-

talong Beach, 2257, 043 24 2711, 1st and 3rd Tuesday every month at Applied Technology, West Gosford, for all types of computer.

**Commodore Users Group**, John Guidice, G.P.O. Box 4721, Sydney, 2001.

**Compucolor Users Group**, Tony Lee, 52 Cowan Road, St. Ives 2075, phone (02) 449 8824.

**Cumberland Computer User Group**, S. O'Neil, 02 682 3851.

**DEC Personal Computer Special Interest Group**, Marion Rhydderch, DEC Australia, Northern Tower, Chatswood Plaza, Railway Street, Chatswood 2067, 02 412 5252.

**Dubbo and District Microbee Users Group**, Coralie Taylor, 18 Cunningham Street, Dubbo 2830, meets 4th Wednesday each month at 7.30 in the Dubbo High School Computer Room.

**A.P.F. Users Group**, Norm McMahon, 288 Kissing Point Road, TURRAMURRA, 2074, 02 44 2645.

**Hawkesbury Commodore Computer Club**, Richard Farrell, 12 Inverary Drive, Kurmond 2757, meets 4th Tuesday of each month at 7.30pm at Neighbourhood Centre, West Market Street, Richmond.

**Hawkesbury MicroBee Computer Club**, Bruce Rennie, 045 67 7329.

**HP Desktop Computer Users Group**, Dr. R. W. Harris, CSIRO Division of Mineral Physics, PMB 7, Sutherland 2232, 02 543 3460.

**Hunter U. G.- All Microcomputers**, Secretary, P.O. Box 39, BROADMEADOW NSW, 2298, Meets on the second Wednesday of each month in Room 308, building W, University of Newcastle at 7.45pm. Membership is primarily Apple II orientated, but anyone with interest in micros welcome.

**Illawarra Microbee Computer Club**, Ronald Read, 49 Beatus Street, Unanderra, 2526.

**Illawarra Super 80 Users Group**, Jim O'Grady, Chairman, P.O. Box 1775, Wollongong, 2500.

**Kaypro Users Group N.S.W.**, Harry Richards, 4/2 Bortfield Drive, Chiswick, 2046, 02 713 1585, meets 2nd Tuesday each month at 8.00 pm in the Burwood R.S.L.

**Sydney Lotus 1-2-3 User Group**, Ron Pollak, (02) 29 5316.

**Macarthur Computer Association**, J Napier, 23 Athel Tree Crescent, Bradbury 2560, meets first Monday each month at Airs High School, Briar Road Campbelltown at 7.30 each month, all machines are catered for, 046 25 2055.

**Macquarie Microbee Users Group**, Brian Thompson, meetings first Monday each month at Denistone East Primary School at 7.30 pm, 02 85 1659 after hours.

**MEGS (Microcomputer Enthus. Group)**, John Whitlock, P.O. Box 1309, Chatswood 2067. Meetings third Monday each month at rear of St. Andrew's Presbyterian Church, 37 Anderson Street, Chatswood, (02) 638 1142.

**Mi Computer Club**, Norma Jackson, P.O. Box 21, Waterloo, 2017, 02 662 8888.

**Microbee Users Club (Broken Hill)**, Peter Cotter, 533 Radium Street, Broken Hill 2880, 080 88 1621.

**Newcastle Microbee Users Group**, Lee Osman, 12 Cleverton Close, Warners Bay 2282, 049 48 8813.

**Newcastle Microcomputer Club**, Angus Bliss, PO Box 293, Hamilton 2303, meetings 2nd and 4th Monday each month at room G12, Physics Building, Newcastle Uni, 049 67 2433.

**N.S.W. Primary School Microbee Users Group**, Mr Peter Stretton, c/- Hunters Hill Primary School Alexandra Street, Hunters Hill 2110.

**N.S.W. 6800 Users Group**, 27 Georgina Ave., Keiraville, 2500.

**Northern Beaches Vic User Group**, E. Tuxford, 161 Barrenjoey Rd., Newport, 2106, Ph 997 2467, Community Centre (If We're lucky).

**Northern N.S.W. MICC Chapter**, Alen Hartley, Dundurrabin via Dorrigo, 2433, 066 57 8160.

**N.S.W. Peach User Club**, Daniel Soussi, 02 698 8286, weekly meetings on Saturday from 2pm at 'Cybernetics Research' 120-122 Lawson St Redfern.

**OSI Users Group**, Nigel Bisset, 02 411 7142.

**Pocket Computer Users Club**, George Antonijevic, 02 683 4296, for those interested in pocket computers, whatever the brand.

Meetings held on the first Wednesday of each month at 7.30pm at the 'Woodstock' Community Centre, Church St. Burwood.

**Sorcerer Users Group**, P.O. Box E162, St James, 2000, meetings 1st Tuesday each month at 7th Floor Datec House, 220 George Street, Sydney at 7.30pm.

**Southern Districts Commodore Users Group**, Lex Toms, 602 8691, 3 Lucille Crescent, Casula 2170, Meetings 1st and 3rd Wednesday each month, API Hall Currajong Road, Prestons.

**Sutherland Super 80 Group**, Jim Traeger, 02 525 2018, Super 80.

**Sydcom 64 (C64 User Group)**, Andrew Farrell, meetings first Tuesday of each month at 6.30 pm above Computerwave, George Street, Sydney, 02 99 2640.

# UNLEASH THE MUSIC IN YOUR COMMODORE 64

SIGHT & SOUND  
Music Software, Inc.

## THE INCREDIBLE MUSICAL KEYBOARD

Now with no musical experience you can unleash the music that's hidden deep within your computer. This unique keyboard comes complete with its own software that will get you playing right away. It even includes two music books, one for the beginner, and one for the more advanced musician.

### KAWASAKI SYNTHESISER

This transforms your computer into a programmable synthesiser and sound processor. Use the polyphonic keyboard and preset sounds to create your own music. Unique three-track recording capabilities to produce an unlimited number of instrument sounds and special effects.

### KAWASAKI RHYTHM ROCKER

Create space sounds and hi-resolution colour graphics to the beat of electronic rhythms. This creative Music/Video synthesiser offers a variety of percussion and synthesiser sounds that can be laid down on top of pre-programmed bass lines.

### MUSIC PROCESSOR

Create, edit, record, play and compose your own musical arrangements. Use your joystick to change any of the 99 preset instrument and special effect sounds. Full music editor allows you to create new music or change one of the 16 pre-recorded tunes. See visual musical notation on the screen. Music Processor is compatible with the entire computer song album series.

### TUNE TRIVIA

Challenge yourself and your friends to music trivia from an almost infinite number of songs and questions. Four fascinating games in one, add your own tunes and trivia questions, try to stump your friends. Tune Trivia comes complete with superstar songbook and full documentation.

### COMPUTER SONG ALBUMS

Listen to the hits of Michael Jackson, Willie Nelson, Denise Williams, The Eurythmics, while you control computer generated instruments and special effects. Every musical arrangement comes complete with bass, rhythm, melody and harmony. Computer Song Albums are also compatible with the music video kit soon to be released.

# Ozi Soft™

AUSTRALIAN DISTRIBUTORS.

(02) 211-1266

### FUTURE 1984 RELEASES INCLUDE:

#### Music Video Kit -

Make your own music videos with this powerful graphics processor. Paint a background scene, then synchronize your masterpiece to your music.

#### 3001 Sound Odyssey -

Travel through a complete tutorial on musical synthesis. Learn how subtle change in A.D.S.R., waveforms, ring modulation and filters work together, then create your own music.
